| Element                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Use HTTP banner from File URL | Whether you want to use your own web page to authenticate HTTP connections. Enter the URL for your HTTP banner.<br><br>If you configure both HTTP banner text and a URL, the URL banner take precedence; however, the banner text is also configured on the device.                                                                                                                                                                                                                                                                                                                                                               |
| <b>Advanced Tab</b>           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Global Inactivity Time        | The length of time, in minutes, that the authentication proxy for a user is maintained when there is no user activity in the session. If this timer expires, the user session is cleared along with its dynamic user access control list (ACL), and the user must re-authenticate. The range is 1 to 2,147,483,647. The default is 60 minutes.<br><br>Ensure that this timeout value is greater than or equal to the idle timeout values configured in the <b>Firewall &gt; Settings &gt; Inspection</b> policy; otherwise, timed-out user sessions might continue to be monitored and eventually hang.                           |
| Global Absolute Time          | The length of time, in minutes, that an authentication proxy user session can remain active. After this timer expires, the user session must go through the entire process of establishing its connection as if it were a new request. The range is 0 to 35,791. The default is 0, which means that there is no global absolute timeout; user sessions are maintained as long as they are active.                                                                                                                                                                                                                                 |
| Interface Timeout Table       | This table contains the interfaces for which you want to configure timeout values that differ from the global timeout values. If you want to use the global values for all interfaces, you do not need to configure anything in this table. <ul style="list-style-type: none"> <li>To add an interface with customized timeout values, click the <b>Add Row</b> button and fill in the <a href="#">Firewall AAA IOS Timeout Value Setting, page 15-27</a>.</li> <li>To edit a setting, select it and click the <b>Edit Row</b> button.</li> <li>To delete a setting, select it and click the <b>Delete Row</b> button.</li> </ul> |

## Firewall AAA IOS Timeout Value Setting

Use the Firewall AAA IOS Timeout Value Setting dialog box to configure idle and absolute timeout values for specific interfaces. These values override the global timeout values configured on the **Firewall > Settings > ScanSafe Web Security** policy Server Timeout tab.

### Navigation Path

From the Advanced tab of the [AAA Page, page 15-25](#), click the **Add Row** button beneath the table of interfaces, or select a row and click the **Edit Row** button.

Table 15-9 Firewall AAA IOS Timeout Value Setting Dialog Box

| Element                           | Description                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interfaces                        | The interfaces or interface roles for which you are configuring timeout values. Enter the names of the interfaces or roles, or click <b>Select</b> to select them from a list or to create new interface roles. Separate multiple entries with commas.                                                                                                                                                                 |
| <b>Auth Proxy Tab</b>             |                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Inactivity/Cache Time             | The length of time, in minutes, that the authentication proxy for a user is maintained when there is no user activity in the session on the interface. If this timer expires, the user session is cleared along with its dynamic user access control list (ACL), and the user must re-authenticate. The range is 1 to 2,147,483,647. The default is the global inactivity timeout value (whose default is 60 minutes). |
| Absolute Time                     | The length of time, in minutes, that an authentication proxy user session can remain active on the interface. After this timer expires, the user session must go through the entire process of establishing its connection as if it were a new request. The range is 1 to 35,791. The default is 0, which means that there is no absolute timeout; user sessions are maintained as long as they are active.            |
| Authentication Proxy Method (IOS) | The protocols to which these timeout values should apply. You can select any combination of HTTP, FTP, or Telnet.                                                                                                                                                                                                                                                                                                      |

|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>HTTP/NTLM Tab</b>                  | The HTTP and the NTLM areas contain the same following fields and selections:<br><br>Set the <b>Inactivity/Cache Time</b> and the <b>Absolute Time</b> for HTTP/NTLM and then, if desired, select Enable Passive Authentication. Finally, select the <b>Identity Policy</b> that you want to apply.                                                                                                                                                                |
| <b>Method Order Tab</b>               | Select the checkbox of each method you want to employ and then use the up and down arrows to arrange the methods in the order you desire.                                                                                                                                                                                                                                                                                                                          |
| <b>AAA Settings Tab</b>               | Select the <b>AAA Settings</b> tab to specify the Authentication, Authorization, and Account settings as detailed below.                                                                                                                                                                                                                                                                                                                                           |
| <b>Authenticate Using</b>             | In the Authenticate Using section you can select the server group(s) to use for authentication. Choices are: <ul style="list-style-type: none"> <li>• <b>None</b>—No authentication</li> <li>• <b>Default</b>—Use the default authentication server group(s).</li> <li>• <b>Custom</b>—Enable the selection of user specified authentication server group(s). Then click <b>Select</b> to specify or add a server group.</li> </ul>                                |
| <b>Authorize Exec Operation Using</b> | In the Authorize Exec Operation Using section you can select the server group(s) to use for authorization of executive operations. Choices are: <ul style="list-style-type: none"> <li>• <b>None</b>—No authorization</li> <li>• <b>Default</b>—Use the default authorization server group(s)</li> <li>• <b>Custom</b>—Enable the selection of user specified authorization server group(s). Then click <b>Select</b> to specify or add a server group.</li> </ul> |
| <b>Perform Exec Operation Using</b>   | In the Authorize Exec Operation Using section you can select the server group(s) to use for performing executive operations. Choices are: <ul style="list-style-type: none"> <li>• <b>None</b>—No authorization</li> <li>• <b>Default</b>—Use the default server group(s)</li> <li>• <b>Custom</b>—Enable the selection of user specified server group(s). Then click <b>Select</b> to specify or add a server group.</li> </ul>                                   |
| <b>Accounting Notice</b>              | Use Accounting Notice to specify accounting operations. <ul style="list-style-type: none"> <li>• <b>None</b>—No accounting notices</li> <li>• <b>Start-stop</b>—Accounting notices at the beginning and end of operations</li> <li>• <b>Stop-only</b>—Accounting notices at the end of operations.</li> </ul>                                                                                                                                                      |
| <b>Accounting Server Groups</b>       | Specify what accounting server groups to use. Either enter or select the Accounting Server group.<br><br><b>Note</b> If you choose to select an accounting server group, you are also give the option to add an Accounting Server group.                                                                                                                                                                                                                           |
| <b>Use Broadcast for Accounting</b>   | Select this checkbox to broadcast accounting notices.                                                                                                                                                                                                                                                                                                                                                                                                              |

# CHAPTER 16

## Managing Firewall Access Rules

---

Access rules define the rules that traffic must meet to pass through an interface. When you define rules for incoming traffic, they are applied to the traffic before any other policies are applied (with the exception of less common AAA rules). In that sense, they are your first line of defense.

**Tip**

---

For some types of devices, you can configure IPv6 access rules in addition to IPv4 access rules. For information on supported device types, see [IPv6 Support in Security Manager, page 1-7](#).

## Understanding Access Rules

Access rules policies define the rules that allow or deny traffic to transit an interface. Typically, you create access rules for traffic entering an interface, because if you are going to deny specific types of packets, it is better to do it before the device spends a lot of time processing them.

When you deploy access rules to devices, they become one or more entries (ACEs) to access control lists (ACLs) that are attached to interfaces. Typically, these rules are the first security policy applied to packets; they are your first line of defense. You use access rules to filter out undesired traffic based on service (protocol and port numbers) and source and destination addresses, either permitting the traffic or denying (dropping) it. Each packet that arrives at an interface is examined to determine whether to forward or drop the packet based on criteria you specify. If you define access rules in the out direction, packets are also analyzed before they are allowed to leave an interface.

**Tip**

For ASA 8.3+ devices, you can augment interface-specific access rules with global access rules. For more information, see [Understanding Global Access Rules, page 16-3](#).

When you permit traffic in an access rule, subsequent policies might end up dropping it. For example, inspection rules, web filter rules, and zone-based firewall rules are applied after a packet makes it through the interface's access rules. These subsequent rules might then drop the traffic based on a deeper analysis of the traffic; for example, the packet header might not meet your inspection requirements, or the URL for a web request might be for an undesired web site.

Thus, you should carefully consider the other types of firewall rules you intend to create when you define access rules. Do not create a blanket denial in an access rule for traffic that you really want to inspect. On the other hand, if you know that you will never allow a service from or to a specific host or network, use an access rule to deny the traffic.

Keep in mind that access rules are ordered. That is, when the device compares a packet against the rules, it searches from top to bottom and applies the policy for the first rule that matches it, and ignores all subsequent rules (even if a later rule is a better match). Thus, you should place specific rules above more general rules to ensure those rules are not ignored. To help you identify cases where IPv4 rules will never be matched, and to identify redundant rules, you can use the automatic conflict detection and policy query tools. For more information, see [Using Automatic Conflict Detection, page 16-25](#) and [Generating Policy Query Reports, page 12-28](#).

The following are additional ways in which you can evaluate your access rules:

- Combine rules—You can use a tool to evaluate your IPv4 rules and combine them into a smaller number of rules that perform the same functions. This can leave you with a smaller, easier to manage list of rules. For more information, see [Combining Rules, page 12-22](#).
- Generate hit counts—You can use a tool to view the hit count statistics maintained by the device for IPv4 and IPv6 ACLs. This can tell you how often a rule has permitted or denied traffic. For more information, see [Viewing Hit Count Details, page 16-33](#).
- View events collected by CS-MARS—You can analyze real time or historical events related to an IPv4 rule using the Cisco Security Monitoring, Analysis and Response System application if you configured it to monitor the device and you configure the rule to generate syslog messages. For more information, see [Viewing CS-MARS Events for an Access Rule, page 69-28](#).

## Understanding Global Access Rules

Traditionally, access rules (ACLs), which control which traffic can flow through a device, are applied to device interfaces. However, with ASA devices running software release 8.3+, you have the option to create global access rules for IPv4 and IPv6.

Global access rules are defined as a special ACL that is processed for every interface on the device for traffic entering the interface. Thus, although the ACL is configured once on the device, it acts like a secondary interface-specific ACL defined for the In direction. (Global rules are always for the In direction, never the Out direction.)

When traffic enters an interface on an ASA 8.3+ device, when applying ACLs, the device first applies any interface-specific access rules to the traffic. It then applies global rules. (Overall processing is explained in [Understanding the Processing Order of Firewall Rules, page 12-2](#).)

Global rules are best used for rules that you want to apply to all traffic that enters a device regardless of which interface it enters. For example, there might be a specific host or subnet that you always want to deny or permit. You can create these as global rules, so they are configured once on the device instead of configured again for each interface (although functionally the same as an interface-specific rule configured for the All-Interfaces role, All-Interfaces rules are repeated for each interface rather than being configured once on the device).

### Tip

If you want to configure the same set of global rules for more than one device, create a shared policy and inherit it in the IPv4 or IPv6 access rules policy for each device. Ensure that all global rules are in the Default section of the shared policy. If you put any global rules in the Mandatory section, you will not be able to inherit it on devices that have local interface-specific access rules defined. For more information on shared and inherited policies, see [Local Policies vs. Shared Policies, page 5-3](#) and [Understanding Rule Inheritance, page 5-4](#).

When you configure access rules for an ASA 8.3+ device in Security Manager, interface-specific and global rules are configured in the same policy. However, because the device always processes interface-specific rules first, Security Manager prevents you from intermixing these different types of rules. Therefore, if you configure both interface-specific and global rules on a device, keep the following in mind:

- Global rules always come last in the access rules policy. All interface-specific rules come before global rules.
- You cannot move rules in a way that violates the required order. For example, you cannot move an interface-specific rule below a global rule, or a global rule above an interface-specific rule.
- You cannot create rules in a location that violates the required order. For example, if you select an interface-specific rule, and another interface-specific rule follows it in the table, you cannot create a global rule. If you try to create the wrong kind of rule, when you save the rule, Security Manager

will ask you if the rule can be created at the nearest valid location. You must accept the suggestion or the rule will not be added to the table. You can always move the rule after creating it if the suggested location is not ideal (but without violating the rules on order).

- You cannot inherit a policy if the rules in the inherited policy will violate the required order. For example, if you create global rules in the device policy, and try to inherit a shared policy that contains interface-specific rules in the Default section, Security Manager will prevent you from inheriting the policy.
- After assigning or inheriting a shared policy, you cannot edit the policy in a way that will violate rule order on any device that uses the policy.
- If you assign or inherit a policy that contains global rules on a device that does not support them, all global rules are ignored and not configured on the device. For example, if you permit all traffic from host 10.100.10.10 in a global rule in a shared policy, and assign that policy to an IOS device, the rule permitting 10.100.10.10 access is not configured on the IOS device, and traffic from that host is handled either by another interface-specific policy, or the default deny all policy. As a good practice, you should not assign shared policies that contain global rules to devices that do not support them, to ensure that you do not mistakenly believe the policy defined in a global rule is being configured on the unsupported device.

There are also some changes in how certain tools work with global rules:

- Find/Replace—You can search for global rules by using the Global interface name. However, there is no way to convert between global and interface-specific rules. Although you can find global rules using the Global interface name, if you try to replace an interface name with the name “Global,” you are actually creating an interface-specific access rule that uses a policy object named Global.
- Rule Combiner—Interface-specific and global rules are never combined.

## Understanding Device Specific Access Rule Behavior

If you do not create an access rule policy, the following is the default behavior based on the type of device, and what happens when you create an access rule:

- IOS devices—Permit all traffic through an interface.  
When you create an access rule permitting source A to destination B without configuring TCP/UDP inspection on the inspection rule table, or configuring the **established** advanced option on the rule, the device permits any packet from A to B. However, for any returning packet from B to A, the packet is not allowed, unless there is a corresponding access rule permitting that packet. If you configure TCP/UDP inspection on the traffic the inspection rule table, a rule permitting B to A is not needed in the access rule, as any returning packet from B to A automatically passes the device.
- ASA and PIX devices—Permit traffic from a higher-security interface to a lower-security interface. Otherwise, all traffic is denied.

If an access rule allows TCP/UDP traffic in one direction, the appliance automatically allows return traffic (you do not need to configure a corresponding rule for the return traffic), except for ICMP traffic, which does require a return rule (where you permit the reverse source and destination), or you must create an inspection rule for ICMP.

- FWSM devices—Deny all traffic entering an interface, permit all traffic leaving an interface.

You must configure access rules to allow any traffic to enter the device.

If you create any rules for an interface for any type of device, the device adds an implicit **deny any** rule at the end of the policy. It is a good practice for you to add this rule yourself so that you remember it is there. Adding the rule also allows you to get hit count information for the rule. For more information, see [Viewing Hit Count Details, page 16-33](#).

Tip

---

When you create the access rule policy, ensure that you include a rule that will permit access to the device from the Security Manager server, or you will not be able to manage the device using the product.

## Understanding Access Rule Address Requirements and How Rules Are Deployed

One of the complexities of creating access control lists using the operating system commands on the command line interface (CLI) is the fact that different operating systems have different IP address formats for source and destination addresses.

For example, Cisco IOS Software requires that you enter addresses using wildcard masks instead of subnet masks. To create a rule for the 10.100.10.0/24 network (subnet mask 255.255.255.0), you are required to enter the address as 10.100.10.0 0.0.0.255. The 0 and 1 have the reverse meaning in a wildcard mask that they have in a subnet mask. In ASA, PIX, and FWSM software, however, you use subnet masks, so you enter 10.100.10.0 255.255.255.0.

Security Manager simplifies addressing requirements for access rules: you always use the subnet mask. You are not even allowed to enter a wildcard mask. When you deploy the access rules to a device, Security Manager considers the operating system of the device and converts subnet masks to wildcard masks automatically when needed.

This makes it possible for you to create shared rules based on logical policies and to apply those rules to all of your devices. For example, there might be a set of access rules that you want all devices to use, in which case you can create the shared policy and assign it as the inherited policy for all devices. You do not have to worry about defining rules using the “right” syntax for the device type. You can use the same network/host objects that you use in other types of policies to identify targeted hosts and networks.

The specific CLI commands generated in deployed configurations are also based on the type of device. For IOS devices, the **ip access-list** command is used. For ASA, PIX, FWSM devices, the **access-list** or **ipv6 access-list** command is used and the **access-group** command binds it to the interface. With ASA, PIX, FWSM, and IOS 12.4(20)T+ devices, if you use network/host objects to identify the source or destination addresses for a rule, the **object-group** command is used to create object groups for those network/host objects. Object groups are also created for service objects.

**Tips**

- Because you can use network/host objects to identify a source or destination, and you can configure deployment optimization for rules, there is not always a one-to-one relationship between an access rule and ACEs in the CLI definition of an ACL.
- All access lists created from firewall rules are extended access lists (rather than standard). Security Manager applies a system-generated name to the ACL unless you specify a name for the ACL on the [Access Control Settings Page, page 16-21](#). The name applies to the ACL that includes all of the rules related to the interface and direction for which the name is defined.
- There are several deployment options that control how object groups are deployed. This topic describes the default behavior. On the [Deployment Page, page 11-9](#) (select **Tools > Security Manager Administration > Deployment**), you can deselect the option to create object groups from network/host objects. You can also optimize object groups during deployment (see [Optimizing Network Object Groups When Deploying Firewall Rules, page 12-35](#)), create new object groups from rules with multiple services or source and destination addresses, or remove unused object groups.
- The deployment options also include settings that control the names of ACLs generated from access rules and how many ACLs are created. By default, Security Manager creates a unique ACL for each interface, even if this means that several duplicate ACLs are created.

If you select **Enable ACL Sharing for Firewall Rules**, Security Manager can create a single ACL and apply it to multiple interfaces, thus avoiding the creation of unnecessary duplicate ACLs. However, ACL sharing occurs only if it can be done while preserving your ACL naming requirements:

- If you specify an ACL name for an interface and direction, that name is always used, even if it means a duplicate ACL must be created. For more information, see [Configuring Settings for Access Control, page 16-20](#).
- If you select **Reuse existing names** for the Firewall Access-List Names property, the existing names are preserved (unless you override them in the access control settings policy). This means that you might end up with duplicate ACLs under different names if duplicate ACLs already exist on the device.

**Tip:** To maximize ACL sharing, ensure that you select **Reset to CS-Manager Generated Names** for the Firewall Access-List Names property, select **Speed** for the Optimize the Deployment of Access Rules For property, and that you do not configure ACL names in the access control settings policy.

For more detailed information about the **Enable ACL Sharing for Firewall Rules** property, see [Deployment Page, page 11-9](#).

- IPv4 and IPv6 ACLs cannot have the same name.

# Configuring Access Rules

Access rules policies define the rules for allowing traffic to pass through an interface. If you do not configure an access rules policy, the device behavior differs based on device type as explained in [Understanding Device Specific Access Rule Behavior, page 16-4](#).

**Note**

With the release of Security Manager 4.4 and versions 9.0 and higher of the ASA, the separate pages/policies for configuring IPv4 and IPv6 access rules were unified. However, for the earlier ASA versions, a separate page for IPv6 access rules is still provided in Device view. In Policy view, IPv4 and unified versions of the policy type are provided. In addition, a utility that you can use to convert IPv4 policies is provided (see [Converting IPv4 Rules to Unified Rules, page 12-28](#)). The following descriptions apply to all versions of the access rule table, except where noted.

Before you configure access rules, consider the other types of firewall rules you will configure. Access rules are processed before all other types of rules except AAA rules. See the following topics for more information about things you should consider:

- [Understanding Access Rules, page 16-1](#)
- [Understanding Global Access Rules, page 16-3](#)
- [Understanding Access Rule Address Requirements and How Rules Are Deployed, page 16-5](#)

**Before You Begin**

You might have a set of access rules that you want to apply to all devices. To do this, you can create a shared rule and inherit its rules to each device's access rules policy. For more information, see [Creating a New Shared Policy, page 5-51](#) and [Inheriting or Uninheriting Rules, page 5-43](#).

**Related Topics**

- [Using Sections to Organize Rules Tables, page 12-20](#)
- [Copying Policies Between Devices, page 5-31](#)
- [Working with Shared Policies in Device View or the Site-to-Site VPN Manager, page 5-34](#)
- [Understanding Networks/Hosts Objects, page 6-74](#)
- [Understanding Interface Role Objects, page 6-67](#)
- [Understanding and Specifying Services and Service and Port List Objects, page 6-86](#)

- 
- Step 1** Do one of the following to open the [Access Rules Page, page 16-9](#):
- (Device view) Select **Firewall > Access Rules** (or **Firewall > Settings > IPv6 Access Rules**) from the Policies selector.
  - (Policy view) Select **Firewall > Access Rules** (or **Firewall > Settings > IPv6 Access Rules**) from the Policy Type selector. Select an existing policy or create a new one.
- Step 2** Select the row after which you want to create the rule and click the **Add Row** button or right-click and select **Add Row**. This opens the [Add and Edit Access Rule Dialog Boxes, page 16-13](#).

**Tip**

If you do not select a row, the new rule is added at the end of the local scope. You can also select an existing row and edit either the entire row or specific cells. For more information, see [Editing Rules, page 12-9](#). Special rules apply if you mix interface-specific and global rules in a policy; for more information, see [Understanding Global Access Rules, page 16-3](#).

- Step 3** Configure the rule. Following are the highlights of what you typically need to decide. For specific information on configuring the fields, see [Add and Edit Access Rule Dialog Boxes, page 16-13](#).
- Permit or Deny—Whether you are allowing traffic that matches the rule or dropping it.
  - Source and Destination addresses—If the rule should apply no matter which addresses generated the traffic or their destinations, use “All-Addresses” as the source or destination. If the rule is specific to a host or network, enter the addresses or network/host objects. For information on the accepted address formats, see [Specifying IP Addresses During Policy Definition, page 6-81](#).
  - Source and Destination Security Groups (ASA 9.0+ only)—You can specify TrustSec security groups used to filter traffic in addition to the source and destination addresses. See [Selecting Security Groups in Policies, page 14-13](#), [Configuring TrustSec-Based Firewall Rules, page 14-13](#) and [Creating Security Group Objects, page 14-12](#) for more information about security groups.
  - Source Users (ASA 8.4.2+ only)—You can further define the traffic source by specifying Active Directory (AD) user names (in the format NetBIOS\_DOMAIN\username), user groups (NetBIOS\_DOMAIN\user\_group), or identity user group objects that define the names and groups. The user specification is conjoined to the source address to limit the match to user addresses within the source address range. For more information, see [Configuring Identity-Based Firewall Rules, page 13-21](#) and [Creating Identity User Group Objects, page 13-19](#).
  - Services—Use the IP service to apply to any traffic (for example, if you want to deny all traffic from a specific source). Otherwise, select the more specific service, which is a protocol and port combination, that you are targeting.
  - Interfaces or Global—The interface or interface role for which you are configuring the rule, or Global to create global access rules on ASA 8.3+ devices (see [Understanding Global Access Rules, page 16-3](#)).
  - Advanced settings—Click **Advanced** to open the Advanced dialog box for configuring additional settings. You can configure the following options; for detailed information, see [Advanced and Edit Options Dialog Boxes, page 16-15](#).
    - Logging options. If you are using Security Manager or CS-MARS to monitor the device, ensure that you enable logging.
    - The direction of traffic to which this rule should apply (in or out). The default is in. You cannot change this setting for global rules.
    - The time range for the rule, which allows you to configure rules that work only for specific periods of time, such as during working hours. For more information, see [Configuring Time Range Objects, page 6-66](#).
    - IOS device options for fragmentation and allowing the return of traffic for established outbound sessions.
    - Rule expiration dates and notification settings. For more information, see [Configuring Expiration Dates for Access Rules, page 16-19](#).

Click **OK** when you are finished defining your rule.

**Note**

If you have conflict detection enabled, Security Manager will analyze the new rule to see if it conflicts or overlaps with other rules. For more information, see [Using Automatic Conflict Detection, page 16-25](#).

- Step 4** If you did not select the right row before adding the rule, select the new rule and use the up and down arrow buttons to position the rule appropriately. For more information, see [Moving Rules and the Importance of Rule Order, page 12-19](#). There are special restrictions for moving rules when you mix interface-specific and global rules; see [Understanding Global Access Rules, page 16-3](#).
- Step 5** If you already have a large number of rules, consider analyzing and combining them before deploying the new rules. You can use the conflict detection tool to analyze your rules (see [Using Automatic Conflict Detection, page 16-25](#)). If analysis shows that you have a lot of redundant rules, right-click anywhere in the rules table and choose **Combine Rules** to combine them. You can either allow Security Manager to evaluate all rules for combination, or just the rules you select before starting the rule combination tool. For more information, see [Combining Rules, page 12-22](#).

## Access Rules Page

Use the Access Rules page to configure access control rules for device interfaces. Access rules policies define the rules that allow or deny traffic to transit an interface. Typically, you create access rules for traffic entering an interface, because if you are going to deny specific types of packets, it is better to do it before the device spends a lot of time processing them. Access rules are processed before other types of firewall rules.

**Note**

With the release of Security Manager 4.4 and versions 9.0 and higher of the ASA, the separate policies and objects for configuring IPv4 and IPv6 access rules were “unified,” meaning one set of access rules in which you can use either IPv4 or IPv6 addresses, or a mixture of both. (See [Policy Object Changes in Security Manager 4.4, page 1-9](#) for additional information.) In Policy view, IPv4 and unified versions of the access policy type are provided. In addition, a utility that you can use to convert existing IPv4 policies is provided (see [Converting IPv4 Rules to Unified Rules, page 12-28](#)). The following descriptions apply to apply to all versions of the access rule table, except where noted.

Read the following topics before you configure access rules:

- [Understanding Access Rules, page 16-1](#)
- [Understanding Global Access Rules, page 16-3](#)
- [Understanding Device Specific Access Rule Behavior, page 16-4](#)
- [Understanding Access Rule Address Requirements and How Rules Are Deployed, page 16-5](#)
- [Configuring Access Rules, page 16-7](#)

**Tip**

Disabled rules are grayed out. When you deploy the configuration, disabled rules are removed from the device. For more information, see [Enabling and Disabling Rules, page 12-20](#).

**Navigation Path**

To open the Access Rules page, do one of the following:

- (Device view) Select a device, then select **Firewall > Access Rules** (or **Firewall > Settings > IPv6 Access Rules**) from the Policies selector.
- (Policy view) Select **Firewall > Access Rules** (or **Firewall > Settings > IPv6 Access Rules**) from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click a device and select **Edit Firewall Policies > Access Rules** (or **Edit Firewall Policies > IPv6 Access Rules**).

#### Field Reference

#### Note

For details on the fields and user interface elements available as part of the automatic conflict detection feature, see [Understanding the Automatic Conflict Detection User Interface, page 16-27](#).

**Table 16-1** Access Rules Page

| Element                           | Description                                                                                                                                                                                                                                                                            |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Expand all rows/Collapse all rows | Use these buttons to expand or collapse all sections in the rules table.<br><b>Note</b> The buttons are located in the upper-right corner of the Filter area above the access rules table.                                                                                             |
| Conflict Indicator icons          | Identifies conflicts and provides a quick visual representation of the type of conflict. For more details, including types of conflicts and the actions you can take from this column, see <a href="#">Understanding the Automatic Conflict Detection User Interface, page 16-27</a> . |
| No.                               | The ordered rule number.                                                                                                                                                                                                                                                               |
| Permit                            | Whether a rule permits or denies traffic based on the conditions set: <ul style="list-style-type: none"> <li>• Permit—Shown as a green check mark.</li> <li>• Deny—Shown as a red circle with slash.</li> </ul>                                                                        |
| Sources                           | The sources of traffic for this rule; can be networks, security groups (ASA 9.0+ only), and users. Multiple entries are displayed on separate lines within the table cell.                                                                                                             |
| Destinations                      | The destinations for this rule; can be networks and security groups (ASA 9.0+ only). Multiple entries are displayed on separate lines within the table cell.                                                                                                                           |

**Table 16-1 Access Rules Page (Continued)**

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Service         | The services or service objects that specify the protocol and port of the traffic to which the rule applies. Multiple entries are displayed on separate lines within the table cell. See <a href="#">Understanding and Specifying Services and Service and Port List Objects</a> , page 6-86.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Hit Count       | <p>Number of times this rule has been “hit”; that is, number of times it has permitted or denied traffic; it is actually the sum of the hit counts for all access control entries (ACEs) created by the rule. This information is useful in debugging the deployed policies.</p> <p>Use the Refresh Hit Count button at the bottom of this page to update the hit information; opens the <a href="#">Hit Count Selection Summary Dialog Box</a>, page 16-18.</p> <p>You can right-click this cell and choose Show Hit Count Details to open the Hit Count Details pane at the bottom of the Configuration Manager window. See <a href="#">Viewing Hit Count Details</a>, page 16-33 for more information.</p> |
| Last Hit Time   | Timestamp for the most-recent hit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Interface       | <p>The interfaces or interface roles to which the rule is assigned. Interface role objects are replaced with the actual interface names when the configuration is generated for each device. Multiple entries are displayed on separate lines within the table cell. See <a href="#">Understanding Interface Role Objects</a>, page 6-67.</p> <p>For ASA 8.3+ devices, global rules are indicated with the name <b>Global</b> and a special icon to distinguish them from rules that use interface or interface role names (for an explanation of the icons, see <a href="#">Specifying Interfaces During Policy Definition</a>, page 6-70).</p>                                                              |
| Dir.            | <p>The direction of the traffic to which this rule applies:</p> <ul style="list-style-type: none"> <li>• In—Packets entering the interface.</li> <li>• Out—Packets exiting the interface.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Options         | Any additional options configured for the rule. These include logging, time range, and some additional IOS rule options. See <a href="#">Advanced and Edit Options Dialog Boxes</a> , page 16-15.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Category        | The category assigned to the rule. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , page 6-12.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Description     | The description of the rule, if any.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Expiration Date | The date on which the rule expires. Expired rules show <b>Expired</b> in bold text. Expired rules are not automatically deleted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Last Ticket(s)  | Shows the ticket(s) associated with last modification to the rule. You can click the ticket ID in the Last Ticket(s) column to view details of the ticket and to navigate to the ticket. If linkage to an external ticket management system has been configured, you can also navigate to that system from the ticket details (see <a href="#">Ticket Management Page</a> , page 11-51).                                                                                                                                                                                                                                                                                                                      |

Page elements below the rules table

**Table 16-1 Access Rules Page (Continued)**

| Element                                                                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable conflict detection<br>Generate Report<br>(neither option presented on the IPv6 Access Control page) | <p>Enable or disable automatic conflict detection. This feature is enabled by default and the setting is managed per user. Disabling conflict detection for one access rules table will also disable the feature for other access rules tables.</p> <p>You can disable conflict detection while creating your rule table or making large modifications and then re-enable it when you are ready to verify your changes. See <a href="#">Using Automatic Conflict Detection</a>, page 16-25.</p> <p><b>Note</b> For details on the fields and user interface elements available as part of the automatic conflict detection feature, see <a href="#">Understanding the Automatic Conflict Detection User Interface</a>, page 16-27.</p> <p>If conflict detection is enabled, you can click the <b>Generate Report</b> button to create an HTML report of any rule conflicts detected. This report can be printed or exported to another application.</p> |
| Refresh Hit Count<br>(not presented on the IPv6 Access Control page)                                       | Click this button to update the hit information displayed in the table; opens the <a href="#">Hit Count Selection Summary Dialog Box</a> , page 16-18.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Query<br>(not presented on the IPv6 Access Control page)                                                   | Click this button to run a policy query, which can help you evaluate your rules and identify ineffective rules. See <a href="#">Generating Policy Query Reports</a> , page 12-28                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Find and Replace button<br>(binoculars icon)                                                               | Click this button to search for various types of items within the table and to optionally replace them. See <a href="#">Finding and Replacing Items in Rules Tables</a> , page 12-16.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Up Row and Down Row buttons (arrow icons)                                                                  | Click these buttons to move the selected rules up or down within a scope or section. For more information, see <a href="#">Moving Rules and the Importance of Rule Order</a> , page 12-19.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Add Row button                                                                                             | Click this button to add a rule to the table after the selected row using the <a href="#">Add and Edit Access Rule Dialog Boxes</a> , page 16-13. If you do not select a row, the rule is added at the end of the local scope. For more information about adding rules, see <a href="#">Adding and Removing Rules</a> , page 12-9.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Edit Row button                                                                                            | Click this button to edit the selected rule. You can also edit individual cells. For more information, see <a href="#">Editing Rules</a> , page 12-9.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Delete Row button                                                                                          | Click this button to delete the selected rule.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Right-click Menu**

A right-click menu is also available. This menu provides access to many of the functions listed above; the options presented depend on the location right-clicked:

- If you right-click a rule in the table, the options may include editing functions relative to the specific table cell right-clicked. For example, the command “Show Hit Count Details” is included when you right-click a Hit Count cell. See [Editing Rules](#), page 12-9 for more information.

- The Import Rules and Combine Rules options are also included in the right-click menu. See [Importing Rules, page 16-37](#) and [Combining Rules, page 12-22](#) for more information about these options.

## Add and Edit Access Rule Dialog Boxes

Use the Add and Edit Access Rule dialog boxes to add and edit security-device access rules.

### Note

With the release of Security Manager 4.4 and versions 9.0 and higher of the ASA, the separate pages for configuring IPv4 and IPv6 access rules were unified. However, for the earlier ASA versions, a separate page for IPv6 access rules is still provided. The following descriptions apply to all versions of the page, except where noted.

Read the following topics before you configure access rules:

- [Understanding Access Rules, page 16-1](#)
- [Understanding Global Access Rules, page 16-3](#)

**Table 16-2** Add and Edit Access Rule Dialog Boxes

| Element     | Description                                                                                                                                                                                                                                                                                                                                      |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Rule | Check this box to enable this rule, which means the rule becomes active when you deploy the configuration to the device. Deselect to disable the rule while keeping the rule definition. Disabled rules are shown overlaid with hash marks in the rule table. See <a href="#">Enabling and Disabling Rules, page 12-20</a> for more information. |
| Action      | Whether the rule permits or denies traffic based on the conditions you define.                                                                                                                                                                                                                                                                   |

| Element | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sources | <p>Provide traffic sources for this rule; can be networks, security groups, and users. You can enter values or object names, or Select objects, for one or more of the following types of sources:</p> <ul style="list-style-type: none"> <li>• Network – You can specify a various network, host and interface definitions, either individually or as objects. If you Select an interface object as a source, the dialog box displays tabs to differentiate between hosts/networks and interfaces.</li> </ul> <p>The “All-Address” objects do not restrict the rule to specific hosts, networks, or interfaces. These addresses are IPv4 or IPv6 addresses for hosts or networks, network/host objects, interfaces, or interface roles.</p> <p><b>Note</b> You can only specify a fully qualified domain name (FQDN) by providing an FQDN network/host object, or a group object that includes an FQDN object. You cannot directly type in an FQDN.</p> <p>See <a href="#">Understanding Networks/Hosts Objects, page 6-74</a>, <a href="#">Specifying IP Addresses During Policy Definition, page 6-81</a> and <a href="#">Understanding Interface Role Objects, page 6-67</a> for additional information about these definitions.</p> <ul style="list-style-type: none"> <li>• Security Groups (ASA 9.0+) – Enter or Select the name or tag number for one or more source security groups for the rule, if any. See <a href="#">Selecting Security Groups in Policies, page 14-13</a>, <a href="#">Configuring TrustSec-Based Firewall Rules, page 14-13</a> and <a href="#">Creating Security Group Objects, page 14-12</a> for more information about security groups.</li> <li>• Users – Enter or Select the Active Directory (AD) user names, user groups, or identity user group objects for the rule, if any. You can enter any combination of the following: <ul style="list-style-type: none"> <li>– Individual user names: NetBIOS_DOMAIN\username</li> <li>– User groups (note the double \): NetBIOS_DOMAIN\user_group</li> <li>– Identity user group object names.</li> </ul> <p>For more information, see:</p> <ul style="list-style-type: none"> <li>– <a href="#">Selecting Identity Users in Policies, page 13-21</a></li> <li>– <a href="#">Configuring Identity-Based Firewall Rules, page 13-21</a></li> <li>– <a href="#">Creating Identity User Group Objects, page 13-19</a></li> </ul> </li> </ul> <p><b>Note</b> Enter more than one value in any of these fields by separating the items with commas.</p> <p>Each specification is combined with any others to limit traffic matches to only those flows that include all definitions. For example, specified user traffic originating from within a specified source address range.</p> |

**Table 16-2 Add and Edit Access Rule Dialog Boxes (Continued)**

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Destinations                    | Provide traffic destinations for this rule; can be networks or security groups. As with Sources, you can enter values or object names, or Select objects, for one or more destinations of Network and Security Group (ASA 9.0+) type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Services                        | <p>The services that define the type of traffic upon which to act. You can enter or Select any combination of service objects and service types (which are typically a protocol and port combination).</p> <p>Enter more than one value by separating the items with commas.</p> <p>For complete information on how to specify services, see <a href="#">Understanding and Specifying Services and Service and Port List Objects, page 6-86</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Interfaces<br>Global (ASA 8.3+) | <p>Specify whether you are creating an interface-specific or global rule. Global rules are available only for ASA 8.3+ devices, and are handled according to special rules (for detailed information, see <a href="#">Understanding Global Access Rules, page 16-3</a>).</p> <p>If you select <b>Interfaces</b>, enter or Select the name of the interface or the interface role to which the rule is assigned, or click <b>Select</b> to select the interface or role from a list. An interface must already be defined to appear on the list.</p> <p>Interface role objects are replaced with the actual interface names when the configuration is generated for each device. See <a href="#">Understanding Interface Role Objects, page 6-67</a>. Global rules are created as a special global ACL that is not attached to specific interfaces, but are processed for all interfaces in the In direction after interface-specific rules.</p> |
| Description                     | An optional description of the rule (up to 1024 characters).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Category                        | The category assigned to the rule. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-12</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Advanced button                 | Click this button to configure other settings for the rule, including logging configuration, traffic direction, time ranges, and rule expiration dates. For more information, see <a href="#">Advanced and Edit Options Dialog Boxes, page 16-15</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Advanced and Edit Options Dialog Boxes

Use the Advanced dialog box to configure additional settings for an access rule. These settings are displayed in three different cells of the access-rule table: direction, options, and rule expiration. You can then edit those settings directly by right-clicking the appropriate cell.

### Note

With the release of Security Manager 4.4 and versions 9.0 and higher of the ASA, the separate pages for configuring IPv4 and IPv6 access rules were unified. However, for the earlier ASA versions, a separate page for IPv6 access rules is still provided. The following descriptions apply to all versions of the page, except where noted.

**Navigation Path**

To access the Advanced dialog box:

- In the [Add and Edit Access Rule Dialog Boxes, page 16-13](#), click the **Advanced** button.

To access one of the Edit options dialog boxes:

- Right-click the Options or Expiration Date cell in an access rule (on the [Access Rules Page, page 16-9](#)) and choose the related Edit command. To change the rule direction, right-click the Dir. cell and choose the opposite direction (in or out).

If you select multiple rows, your changes replace those options for all selected rules.

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rule Expiration | <p>Lets you configure an expiration date for the rule. Click the calendar icon to select a date. For more information, see <a href="#">Configuring Expiration Dates for Access Rules, page 16-19</a>.</p> <p>If you configure an expiration date, you can also configure the number of days before the rule expires to send out a notification of the pending expiration, and e-mail addresses to which to send the notifications. These fields are initially filled with the information configured on the Rule Expiration administrative settings page (select <b>Tools &gt; Security Manager Administration &gt; Rule Expiration</b>).</p> <p>You can change these options for an existing rule in the table on the <a href="#">Access Rules Page, page 16-9</a> by right-clicking the Expiration Date cell and choosing Edit Rule Expiration.</p> <p><b>Note</b> Expired rules are not automatically deleted. You must delete them yourself and redeploy the configuration to the device.</p> |

## Hit Count Selection Summary Dialog Box

Use the Hit Count Selection Summary dialog box to select the rules for which you want to refresh hit count information. Your options are limited by the rules you selected before clicking the Refresh Hit Count button. When you click OK in this dialog box, updated hit count information is obtained from the device, which can take some time, so you are given the option to abort the operation.

### Tip

You can view detailed hit count information for a rule by right-clicking the Hit Count cell for that rule on the [Access Rules Page, page 16-9](#). Detailed hit count information is displayed in the Hit Count Details window, as described in [Viewing Hit Count Details, page 16-33](#).

### Navigation Path

(Device view only) On the [Access Rules Page, page 16-9](#), select one access rule in the table for which you want detailed hit count information, then right-click the Hit Count column and choose Show Hit Count Details.

| Rules Selected | <p>The rules for which you want to obtain hit count details; choose:</p> <ul style="list-style-type: none"> <li>• Select the <b>rules</b> option to obtain information for only those rules you selected. You can select the rows related to the name of a scope, a section name, multiple individual rules, or create a filter and select all filtered rules. This is the default if any row is selected when you initiate the hit count report.</li> <li>• Select <b>All Rules</b> to get hit counts for all inherited, shared, and local rules. The option is not restricted to the scope indicated in the Policy Selected field.</li> </ul> <p>This is the only available option if you do not select any rules before initiating the hit count report.</p> |

## Configuring Expiration Dates for Access Rules

A frequent use of access rules is to provide temporary access to a network. For example, you might configure an access rule to allow a partner access for the duration of a specific project. Ideally, you want to remove the access rule at the completion of the project. However, as access rule lists grow, it is hard to manage them and to remember which rules were meant to be temporary.

To help you deal with this problem, you can configure expiration dates for access rules. By configuring an expiration date, you can project when you believe the rule will no longer be needed.

Expiration dates are not hard and fast dates; Security Manager does not delete rules that reach their expiration date. Instead, when an expiration date is reached, Security Manager displays “Expired” in bold letters in the Expiration Date column for the rule. You can filter the access rules page based on the expiration date field, for example, filtering for “expiration date has passed” to see all expired rules.

If the rule is no longer needed, you can delete it (right-click and select **Delete Row**), or disable it (right-click and select **Disable**), and then redeploy the configuration to the device. You might want to initially disable the rule, which leaves the rule in the table (overlain with hash marks), in case you discover the rule really was still needed after all, saving you the time of recreating the rule. You then just need to re-enable the rule (right-click and select **Enable**) and redeploy the configuration.

When you configure an expiration date, you can also configure notification settings, specifying an e-mail address that should be notified when an expiration date is approaching. You can specify how many days before the expiration date to send the notification e-mail message to allow you time to evaluate the rule. The notification settings are initially filled with the values configured in the administration settings (select **Tools > Security Manager Administration > Rule Expiration**); you can enter different settings for a given rule.

To configure rule expiration:

- When creating a new rule, or editing an entire rule, click the Advanced button in the [Add and Edit Access Rule Dialog Boxes, page 16-13](#) to get to the rule expiration settings.
- For existing rules, you can add or edit expiration settings without editing the entire rule. Right-click the Expiration Date cell for the rule and select **Edit Rule Expiration**. You can select multiple rows to configure the same rule expiration settings. For more information, see [Advanced and Edit Options Dialog Boxes, page 16-15](#).

## Configuring Settings for Access Control

You can configure various settings that apply to security-device access control lists. These settings work in conjunction with your access rules policy. The main setting of interest is that you can configure your own ACL names for each interface/traffic direction combination, or for the global ACL on ASA 8.3+ devices. For PIX, ASA, and FWSM devices, you can also control the maximum number of concurrent flows and the related syslog interval.

You can also configure an interface to allow per-user downloadable ACLs for PIX, ASA, and FWSM devices. This allows you to configure user-based ACLs in your AAA server to override the ACLs defined on a device.

**Note**

With the release of Security Manager 4.4 and versions 9.0 and higher of the ASA, the separate pages for configuring IPv4 and IPv6 access control were unified. However, for the earlier ASA versions, a separate page for IPv6 settings is still provided. The following descriptions apply to all versions of the page, except where noted.

**Related Topics**

- [Configuring Access Rules, page 16-7](#)

- 
- Step 1** Do one of the following to open the [Access Control Settings Page, page 16-21](#):
- (Device view) Select **Firewall > Settings > Access Control** (or **Firewall > Settings > IPv6 Access Control**) from the Policies selector.
  - (Policy view) Select **Firewall > Settings > Access Control** (or **Firewall > Settings > IPv6 Access Control**) from the Policy Type selector. Select an existing policy or create a new one.
- Step 2** Configure the global settings in the top part of the page. For PIX, ASA, and FWSM devices, you can define the maximum number of concurrent deny flows and the related syslog interval. For ASA 8.3+ devices, you can enable object group search to optimize ACL performance when converting from Checkpoint, but this setting is not recommended unless you have a memory-constrained device. (Not available on the IPv6 Access Control page.)
- For specific information about these settings, and the platforms that support ACL compilation, see [Access Control Settings Page, page 16-21](#).
- Step 3** For each interface on which you want to configure an ACL name, or enable per-user ACLs, add the interface to the interfaces table by clicking the **Add Row** button beneath the table and filling in the [Firewall ACL Setting Dialog Box, page 16-23](#). Keep the following in mind:
- If you configure an ACL name, the name is applied to the specific interface and direction. Security Manager creates system-generated names for any interface/direction combinations that you do not specifically name.
  - You can also specify the name of the global ACL for ASA 8.3+ devices.

You can edit existing entries in the list by selecting them and clicking **Edit Row**, or delete them by clicking **Delete Row**.

---

## Access Control Settings Page

Use the Access Control Settings page to configure settings to use in conjunction with your access rules policy. You can control some performance and logging features, and configure ACL names for individual interfaces.

### Note

With the release of Security Manager 4.4 and versions 9.0 and higher of the ASA, the separate policies and objects for configuring IPv4 and IPv6 access control were “unified,” meaning one set of rules in which you can use either IPv4 or IPv6 addresses, or a mixture of both. However, for the earlier ASA versions, a separate page for IPv6 settings is still provided. (See [Policy Object Changes in Security Manager 4.4, page 1-9](#) for additional information.) The following descriptions apply to all versions of the page, except where noted.

---

Thus, many of these settings apply only to specific device types or software versions. If you configure an option and apply the policy to unsupported device types, the option is ignored for those unsupported devices.

### Navigation Path

To open the Access Control Page, do one of the following:

- (Device view) Select a device, then select **Firewall > Settings > Access Control** (or **Firewall > Settings > IPv6 Access Control**) from the Policies selector.
- (Policy view) Select **Firewall > Settings > Access Control** (or **Firewall > Settings > IPv6 Access Control**) from the Policy Type selector. Create a new policy or select an existing policy.
- (Map view) Right-click a device and select **Edit Firewall Settings > Access Control** (or **Edit Firewall Settings > IPv6 Access Control**).

| Element                                                                                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maximum number of concurrent flows (PIX, ASA, FWSM)<br><br>(not presented on the IPv6 Access Control page)     | The maximum number of concurrent deny flows that the device is allowed to create. Syslog message 106101 is generated when the device reaches the number. The range you should use depends on the amount of flash memory available in the device: <ul style="list-style-type: none"> <li>• More than 64 MB—Values are 1-4096. The default is 4096.</li> <li>• More than 16 MB—Values are 1-1024. The default is 1024.</li> <li>• Less than or equal to 16 MB—Values are 1-256. The default is 256.</li> </ul>                                                                                                                                                                                                      |
| Syslog interval (PIX, ASA, FWSM)<br><br>(not presented on the IPv6 Access Control page)                        | The interval of time for generating syslog message 106101, which alerts you that the security appliance has reached a deny flow maximum. When the deny flow maximum is reached, another 106101 message is generated if the specified number of seconds has passed since the last 106101 message. Values are 1-3600 milliseconds. The default is 300.                                                                                                                                                                                                                                                                                                                                                              |
| Enable Access List Compilation (Global)<br><br>(IPv4 only; also not presented on the IPv6 Access Control page) | Whether to compile access lists, which speeds up the processing of large rules tables. Compilation optimizes your policy rules and performance for all ACLs, but is supported on a limited number of older platforms: <ul style="list-style-type: none"> <li>• Routers (global configuration only): 7120, 7140, 7200, 7304, and 7500.</li> <li>• PIX 6.3 firewalls, in global mode or per interface.</li> </ul> <p>An ACL is compiled only if the number of access list elements is greater than or equal to 19. The maximum recommended number of entries is 16,000.</p> <p>To compile access lists, the device must have a minimum of 2.1 MB of memory. Access list compilation is also known as Turbo ACL.</p> |
| Enable Object Group Search (ASA 8.3+)<br><br>(not presented on the IPv6 Access Control page)                   | Whether to enable object group search on ASA 8.3+ devices, which optimizes ACL performance without expanding object groups. Object group search is mainly for use when migrating from Checkpoint to ASA, which can result in a large increase in the number of access rules, when you have a memory-constrained device (that is, you find during operations that memory runs low). <p>If you enable object group search, you cannot use the Hit Count tool to analyze your rules. In most cases, you should not enable this feature. Instead, use the rule combination tool to simplify your access rules, and consider using global rules for rules you want to enforce on all interfaces.</p>                   |

**Table 16-5 Access Control Settings Page (Continued)**

| Element                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Access Control settings table | <p>The table lists the interfaces for which you want to configure special processing. The interface name can be a specific interface or an interface role (which can apply settings to more than one interface at a time), or Global for global ACL settings on ASA 8.3+ devices.</p> <p>The main use of this table is to configure names for ACLs if you do not want Security Manager to configure system-generated names. The name applies to the ACL generated for an interface in a specific direction.</p> <p>You can also configure interface-level settings for per user downloadable ACLs, object group search, and ACL compilation.</p> <ul style="list-style-type: none"> <li>• To add an Access Control interface setting, click the Add Row button and fill in the <a href="#">Firewall ACL Setting Dialog Box, page 16-23</a>.</li> <li>• To edit an Access Control interface setting, select it and click the Edit Row button.</li> <li>• To delete an Access Control interface setting, select it and click the Delete Row button.</li> </ul> |

## Firewall ACL Setting Dialog Box

Use the Firewall ACL Setting dialog box to configure settings for specific interfaces, interface roles, or global rules for use with security-device access rules policies.

### Navigation Path

Go to the [Access Control Settings Page, page 16-21](#) and click the **Add Row** button below the interface table, or select a row in the table and click the **Edit Row** button.

| Enable Access List Compilation (PIX 6.x)<br>(not presented on the IPv6 Access Control page) | Whether to compile access lists on this interface for PIX 6.x devices. This setting overrides the equivalent global setting that you configure on the Access Control Settings page.<br><br>ACL compilation speeds the processing of large rules tables and optimizes your policy rules and performance for the interface. An ACL is compiled only if the number of access list elements is greater than or equal to 19. The maximum recommended number of entries is 16,000.<br><br>To compile access lists, the device must have a minimum of 2.1 MB of memory. |

## Using Automatic Conflict Detection

Security Manager provides an Automatic Conflict Detection feature for access rules. You can use Automatic Conflict Detection to evaluate the logic of your access rules. When enabled, Automatic Conflict Detection identifies rules that overlap or conflict with other rules in the access rule policy. Use this information to identify rules that need to be deleted, moved, or edited.

This section contains the following topics:

- [Understanding Automatic Conflict Detection, page 16-25](#)
- [Understanding the Automatic Conflict Detection User Interface, page 16-27](#)
- [Resolving Conflicts, page 16-31](#)

## Understanding Automatic Conflict Detection

Security Manager provides an automatic conflict detection feature to help identify unnecessary redundant or duplicate rules. Certain conflicting rules might have no effect on a device after they are deployed; however, they create unnecessary clusters in the rules table. By detecting these rules, you can clean up the rule set to develop an easier to use and more efficient access rules policy.

Other conflicting rules, can create unwanted results to your network. By detecting these conflicting rules, you can identify rules that need to be deleted, moved, or edited to implement your security needs as intended.

### Note

The conflict detection feature will report on the first conflict between two rules. If there are additional rules in the table that also conflict with a rule, they will not be reported until the first conflict is resolved.

Conflicts detected by Security Manager are categorized in the following way:

- **Redundant Object**—An element in a field of a rule is a subset of one or more elements in the same field of the rule. In the following example, the source cell has two network objects: *net-group2* and *net-group1*. Since *net-group2* is a sub-set of *net-group1*, it is a redundant object and can safely be removed:

```
object-group network net-group1
network-object 10.2.0.0 255.255.0.0
```

```
object-group network net-group2
```

```
network-object 10.2.1.1 255.255.255.255
```

- **Redundant Rule**—Two rules apply the same action to the same type of traffic, and removing the base rule would not change the ultimate result. For example, if a rule permitting FTP traffic for a particular network were followed by a rule allowing IP traffic for that same network, and there were no rules in between denying access, then the first rule is redundant and can be deleted.

The following is a simple example of redundant rules:

```
access-list acl permit ip 2.1.1.1 255.255.255.255 any
access-list acl permit ip 2.1.1.0 255.255.255.0 any
```

- **Partially Redundant Rule**—A portion of a compound rule is redundant to a rule or a portion of a compound rule that follows it.
- **Shadowed Rule**—This is the reverse of a redundant rule. In this case, one rule will match the same traffic as another rule such that the second rule will never be applied to any traffic because it comes later in the access list. If the action for both rules are the same, you can delete the shadowed rule. If the two rules specify different actions for traffic, you might need to move the shadowed rule or edit one of the two rules to implement your desired policy. For example, the base rule might deny IP traffic, and the shadowed rule might permit FTP traffic, for a given source or destination.

The following is a simple example of shadowed rules:

```
access-list acl permit ip 1.0.0.0 255.0.0.0 any
access-list acl permit ip 1.1.0.0 255.255.0.0 any
```

---

**Note** Duplicate rules are reported as shadowed rules by the automatic conflict detection feature.

---

- **Partially Shadowed Rule**—A portion of a compound rule is shadowed by a rule before it. If the action for both rules are the same, you can delete the portion of the rule that is shadowed. If the two rules specify different actions for traffic, you might need to move the shadowed rule or edit one of the two rules to implement your desired policy.

### Scope of Automatic Conflict Detection

When detecting conflicts, Security Manager evaluates the following pieces of information in your access rules:

- source
- destination
- services
- users
- interfaces

**Note**

---

Conflict detection is only available for access rules in the Access Rules policy for a device or shared policy. Conflict detection is not available for access rules that are part of other policies, such as AAA or inspection rules.

---

**Note**

---

If a rule contains an FQDN network/host object, the FQDN object is ignored, but the rule is otherwise included in the analysis.

---

**Note**

---

Disabled rules are not evaluated during conflict detection.

---

## Understanding the Automatic Conflict Detection User Interface

The Automatic Conflict Detection feature is tightly coupled with the access rules table to make identifying conflicts and then resolving those conflicts faster and easier. When conflict detection is enabled, additional user interface elements are available for navigating between the conflicts and for resolving those conflicts.

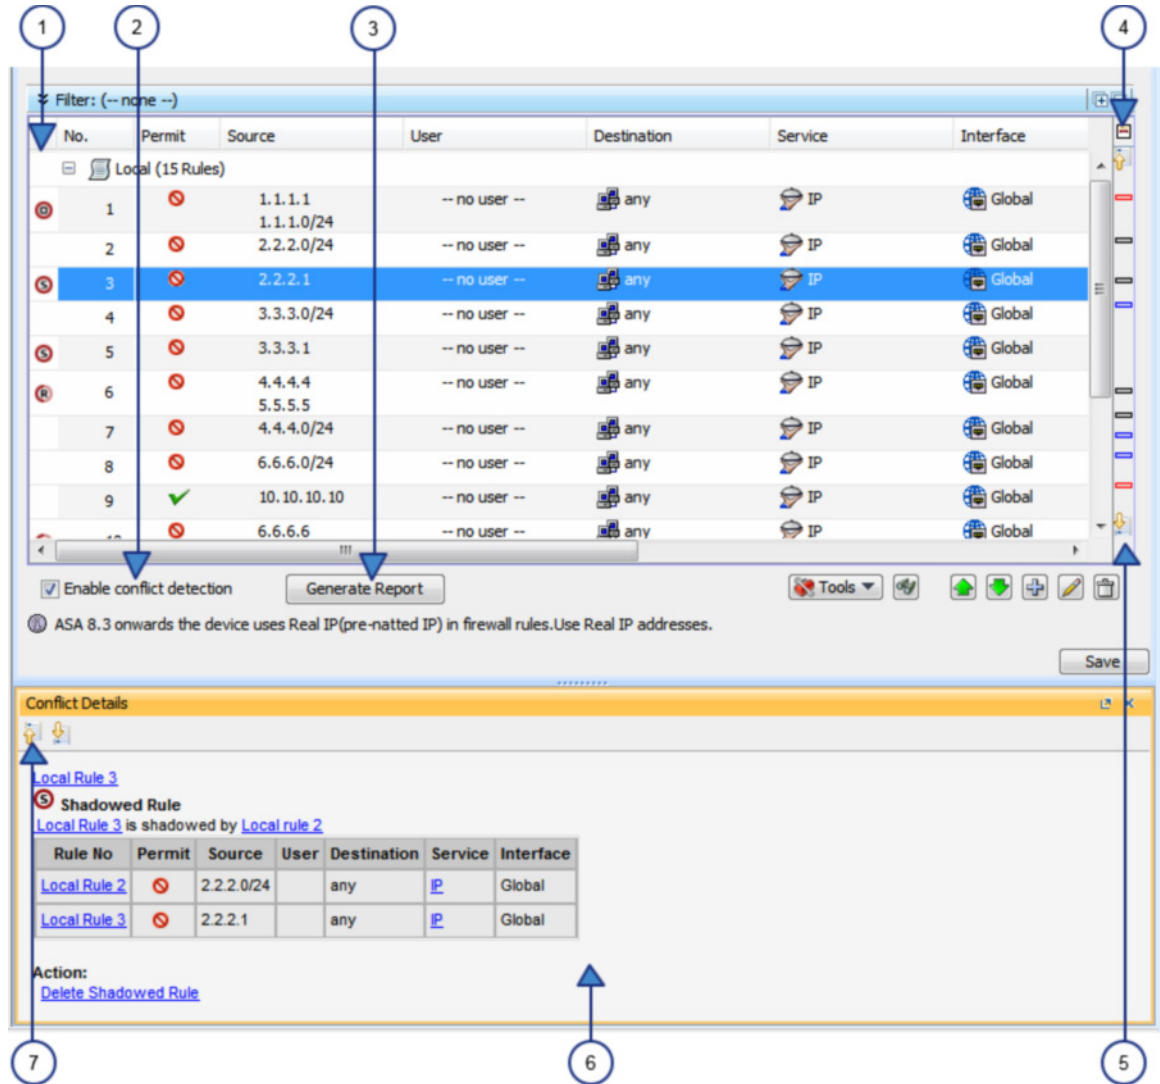

**Note**

---

For information on the standard elements of the Access Rules page, see [Access Rules Page, page 16-9](#).

---

Figure 16-1 Automatic Conflict Detection

|   |                             |   |                            |
|---|-----------------------------|---|----------------------------|
| 1 | Conflict Indicator icons    | 2 | Enable Conflict Detection  |
| 3 | Generate Report button      | 4 | Annotation Display Options |
| 5 | Conflict navigation bar     | 6 | Conflict Details area      |
| 7 | Conflict Navigation buttons |   |                            |

### Conflict Indicator Icons

The Conflict Indicator icons are used to identify conflicts and to provide a quick visual representation of the type of conflict. The following table details the available icons:

**Note**

For an explanation of the types of conflicts, see [Understanding Automatic Conflict Detection](#), page 16-25.

|  |                          |
|--|--------------------------|
|  | Redundant Object         |
|  | Redundant Rule           |
|  | Partially Redundant Rule |
|  | Shadowed Rule            |
|  | Partially Shadowed Rule  |

**Note** If an access rule has multiple conflicts or if it has a user note attached to it, the conflict indicator icon for that rule will have a small plus sign (+) on it.

You can perform the following actions using the Conflict Indicator icon:

- Hover the mouse pointer over the **Conflict Indicator** icon to view a description of the conflict including any user notes attached to the conflict.
- Click the **Conflict Indicator** icon, or right-click the icon and select **Show Conflict Detail**, to open the Conflict Details pane for the selected conflict.
- Right-click the **Conflict Indicator** icon for a redundant object and select **Remove Redundant Object** to remove the redundant object from a rule.
- Right-click the **Conflict Indicator** icon and select **Add User Note** to open the Add User Note dialog box for the selected conflict. You can use the Add User Note dialog box to enter a note about the conflict that can later be included in the Rule Analysis Detail Report.

**Note**

User notes are not saved when leaving the access rules page or after editing a rule that has a user note.

**Enable Conflict Detection**

The Enable Conflict Detection option controls whether automatic conflict detection is enabled. Conflict detection is enabled by default but can be disabled by deselecting this option. The setting is managed per user and enabling or disabling conflict detection for one access rules table, will also enable or disable the feature for other access rules tables.

**Generate Report button**

If conflict detection is enabled, you can click the **Generate Report** button to create an HTML report of the conflicts that can be printed or exported to another tool. The Rule Analysis Detail Report shows details of all the conflicts in your rules table and includes any user notes that were entered for the conflicts. It does not use the settings you selected in the Annotation Display Options dialog box and does not consider the filter settings defined for the table.

**Note**

User notes are not saved when leaving the access rules page or after editing a rule that has a user note.

When you first open the Access Rule page, the Generate Report button is replaced with a progress bar. After conflict analysis has completed, the Generate Report button becomes available along with the other conflict detection features.

### Annotation Display Options button

Click the **Annotation Display Options** button to open the Annotation Display Options dialog box, which is used for selecting the types of conflicts that should be reported. For an explanation of the types of conflicts, see [Understanding Automatic Conflict Detection, page 16-25](#).

Disabling a certain type of conflict does not remove those rules from the access rules table; it only turns off the rule conflict notification for those types of conflicts. To hide or show only conflicting rules of a certain type, you can use the table filter feature. For example, if you only wanted to see redundant and partially redundant rule conflicts, you could set up the following advanced filter:

You can hover the mouse pointer over the Annotation Display Options button to view a summary of the conflicts for each type and also to see which conflict types are disabled.

#### Note

The Annotation Display Options that you select remain in effect until those options are changed. Be sure to verify these settings whenever you are working on resolving conflicts.

### Conflict Navigation Bar

Use the Conflict navigation bar to navigate to a conflict. You can use the Previous Conflict and Next Conflict buttons on the Conflict navigation bar to step through the conflicts. You can also click on one of the conflict locators in the Conflict navigation bar to move directly to a specific conflict. This is particularly helpful when working with large rules tables.

#### Tip

Hovering over a conflict locator provides a quick summary of the conflict.

The conflict locators are color-coded as follows:

- **Red locators**—Redundant objects
- **Blue locators**—Redundant and partially redundant rules
- **Black locators**—Shadowed and partially shadowed rules

### Conflict Details Area

The Conflict Details pane shows details for the selected conflict. The pane can be docked and undocked as needed. If the Conflict Details pane is docked while the Policy Object Manager pane is also docked, you can navigate between the two features using the tabs at the bottom of the window.

The conflicting rules are shown together in a table for easier direct comparison. The type of conflict is shown above the table. A suggested action is shown below the table for all conflicts except partially redundant rules and partially shadowed rules, which must be resolved manually. Links are provided for direct navigation to the rules involved. Policy objects that are part of the conflicting rules can be expanded by clicking on them to see the object contents. Click again to collapse the policy object.

You can use the links provided to navigate to the conflicting rules. You can also click the link under Action to have Security Manager perform the suggested action automatically.

### Conflict Navigation Buttons

The Previous Conflict and Next Conflict buttons at the top of the Conflict Details pane allow you to step through the conflicts that need to be resolved without leaving the Conflict Details pane.

- [Configuring Access Rules, page 16-7](#)

## Resolving Conflicts

The following procedure explains how to use the Automatic Conflict Detection feature to resolve conflicts in your access rules.

---

You can use the Combine Rules tool to have Security Manager evaluate your rules and find ways to combine them into more efficient rules. For more information, see [Combining Rules, page 12-22](#).

---

### Related Topics

- [Understanding Automatic Conflict Detection, page 16-25](#)
- [Understanding the Automatic Conflict Detection User Interface, page 16-27](#)
- [Understanding Access Rules, page 16-1](#)
- [Understanding Device Specific Access Rule Behavior, page 16-4](#)
- [Understanding Access Rule Address Requirements and How Rules Are Deployed, page 16-5](#)
- [Configuring Access Rules, page 16-7](#)

---

**Step 1** Do one of the following:

- (Device view) Select **Firewall > Access Rules** from the Policy selector.

- (Policy view) Select **Firewall > Access Rules** from the Policy Type selector and select an existing policy.

This opens the [Access Rules Page, page 16-9](#). If conflict detection is enabled, the access rules will be analyzed for conflicts after the table has been loaded. If conflict detection is not enabled, select **Enable conflict detection** to begin the conflict analysis.

The analysis progress is shown below the rules table. With the exception of the conflict detection features, you can perform functions on the rules table while the rules are being analyzed. After analysis has completed, the conflict detection features are enabled.

- Step 2** Make sure that the rules you are interested in analyzing are being shown in the rules table. This includes expanding sections and making sure that if you are using filters that they are set correctly. Any rules that are being filtered or are in a section that is collapsed will not be included in the conflict detection analysis.

**Tip** You can use the Expand all rows/Collapse all rows buttons located in the upper-right corner of the Filter area above the access rules table, to quickly expand or collapse all sections in the rules table.

- Step 3** Click the **Annotation Display Options** button, which is located above the Conflict navigation bar to the right of the vertical scroll bar, to open the Annotation Display Options dialog box. Verify that the types of conflicts you want detected are all enabled, and then click **OK**.

**Tip** You can hover the mouse pointer over the Annotation Display Options button to view a summary of the conflicts for each type and also to see which conflict types are disabled.

**Note** The Annotation Display Options that you select remain in effect until those options are changed. Be sure to verify these settings whenever you are working on resolving conflicts.

- Step 4** If you would like to print or save a copy of the conflicts that are found in the rule table, click **Generate Report**.

The Rule Analysis Detail Report is opened in your browser. The Rule Analysis Detail Report shows details of all the conflicts in your rules table. It does not use the settings you selected in the Annotation Display Options dialog box and does not consider the filter settings defined for the table. You can save the report or print it as needed.

- Step 5** Use the Conflict navigation bar to navigate to a conflict. You can use the Previous Conflict and Next Conflict buttons on the Conflict navigation bar to step through the conflicts. You can also click on one of the conflict locators in the Conflict navigation bar to move directly to a specific conflict. This is particularly helpful when working with large rules tables.

**Tip** Hovering over a conflict locator provides a quick summary of the conflict.

The conflict locators are color-coded as follows:

- **Red locators**—Redundant objects
- **Blue locators**—Redundant and partially redundant rules
- **Grey locators**—Shadowed and partially shadowed rules

**Step 6** Click on the **Conflict Indicator** icon for the selected conflict to open the Conflict Details pane. For more information on the Conflict Indicator icons, see [Understanding the Automatic Conflict Detection User Interface, page 16-27](#).

The Conflict Details pane shows details for the selected conflict. The conflicting rules are shown together in a table for easier direct comparison. The type of conflict is shown above the table. A suggested action is shown below the table for all conflicts except partially redundant rules and partially shadowed rules, which must be resolved manually. Links are provided for direct navigation to the rules involved. Policy objects that are part of the conflicting rules can be expanded by clicking on them to see the object contents. Click again to collapse the policy object.

**Step 7** Use the links provided to navigate to the rules and resolve the conflict as needed or click the link under Action to have Security Manager perform the suggested action automatically.

**Note** If you do not want to resolve the conflict at this time, you can enter a note about the conflict by right-clicking the **Conflict Indicator** icon to the left of the conflict in the access rule table and then selecting **Add User Note**. User notes are included in the Rule Analysis Detail Report, but are not saved when leaving the access rules page or after editing a rule that has a user note.

**Step 8** Use the Conflict navigation bar or the **Previous Conflict** and **Next Conflict** buttons at the top of the Conflict Details pane to access additional conflicts that need to be resolved.

**Step 9** If there are any remaining conflicts that you do not want to resolve at this time, you can click **Generate Report** to print or save a copy of the remaining conflicts, if desired.

## Viewing Hit Count Details

Use Hit Count Details window to view information about the number of times an access rule was applied to traffic. These rules are the ones that become interface ACLs on the device. The hit count results do not show counts for any other type of ACL (for example, those used with class maps or AAA rules).

For access rules on ASA 8.3(1) devices and later, the detailed hit count report also shows the last time the access rule policy was applied to traffic. This information is helpful for determining rules that might have been superseded by other policy changes.

Use the hit count information to help you debug your access rules. The information can help you identify rules that are never hit (which might mean you do not need them, or that they are duplicates of rules higher in the ACL), and rules that are hit often (which means you might want to refine the rules).

**Tip**

You can click the Refresh Hit Count button at the bottom of the page to update hit count information before viewing the details for a rule. See [Hit Count Selection Summary Dialog Box, page 16-18](#) for more information.

Consider the following points when analyzing the hit count details:

- You get best results if you deploy policies to the device before viewing hit counts. If you discover a device and then generate a hit count report before deployment, the results might be incomplete or hard to interpret. For example, an access rule might not have any hit count information.

- Hit count statistics are based on ACL, not on interface. If you select **Enable ACL Sharing for Firewall Rules** on the Security Manager Administration Deployment page (see [Deployment Page, page 11-9](#)), any shared ACL provides statistics that are combined from all interfaces that share the ACL.
- If you enable network object group optimization, as described in [Optimizing Network Object Groups When Deploying Firewall Rules, page 12-35](#), you might not get good hit count information.
- If you enable ACL optimization, as described in [Optimizing Access Rules Automatically During Deployment, page 16-43](#), the hit count results might have problems matching ACEs from the device to access rules. Thus, when you select an access rule, you might not get any hit count results for it.
- FQDN network/host objects are ignored. You cannot obtain hit count information on these objects.
- Hit count and last hit time information is cleared when a device is restarted.

### Before You Begin

Hit count reports are subject to the following limitations:

- Hit count reports are device-specific. You can generate the report for one device at a time from Device view only. Ensure that you deploy policies to the device before generating the reports.
- If you enable object group search on an ASA 8.3+ device, you cannot use the Hit Count tool. Object group search is configured on the [Access Control Settings Page, page 16-21](#).
- Although you can select rules that include FQDN network/host objects, the objects are ignored in the hit count results.

### Navigation Path

(Device view only) From the [Access Rules Page, page 16-9](#), right-click the Hit Count cell for a rule in the table and choose **Show Hit Count Details**.

The Hit Count Details window opens as a pane at the bottom of the access rules table. Click the expand button on the right side of its title bar to view the hit count details in a separate window.

| Expanded Table | <p>This view lists hit count information for the access control list entry (ACE) for the rule selected in the Access Rules table (on the <a href="#">Access Rules Page, page 16-9</a>) when you opened this window. The list contains more than one ACE if the access rule generated more than one ACE when you deployed the policy to the device.</p> <p>Most of the columns in this table match those of the Access Rules table; many contain the specific data configured in the ACE in place of any network/host, service, or interface role objects contained in the rule, with the exception of IOS 12.4(20)T+ devices, which show data only at the object level. Also, the name of the ACL that contains the ACE is listed.</p> <p>The Delta column the difference in hit count for the ACE since the last refresh. The Hit Count column shows the hits for the specific ACE rather than the overall rule.</p> <p>See <a href="#">Sample Hit Count Details Window, page 16-35</a> for an example of this table.</p> <p><b>Tip</b> You can sort on multiple columns at the same time by pressing and holding the <b>Ctrl</b> key while you click the column headings. You can sort on all columns except Interface, Direction, and ACL Name.</p> |
| Raw ACE        | <p>This view shows the actual CLI for the access control entry, along with the Hit Count and Last Hit Time. Use this information if you are more comfortable evaluating device commands.</p> <p>See <a href="#">Sample Hit Count Details Window, page 16-35</a> for an example of this table.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Sample Hit Count Details Window

You can generate hit count reports to determine how often each rule in your access rule policy is matched to traffic. If an access rule is deployed as multiple access control entries (ACEs), for example, when you use interface roles to define rules and the roles apply to more than one interface, you can see the separate hit count information for each ACE deployed. The hit count results do not show counts for any other type of ACL (for example, those used with class maps or AAA rules).

For access rules on ASA 8.3(1) devices and later, the hit count report also shows the last time the access rule policy was applied to traffic. This information is helpful for determining rules that might have been superseded by other policy changes.

Use the hit count information to help you debug your access rules. The information can help you identify rules that are never hit (which might mean you do not need them, or that they are duplicates of rules higher in the ACL), and rules that are hit often (which means you might want to refine the rules).

The following figures show an example of a hit count report and how to use the information.

- [Figure 16-2](#) shows the default view. The upper table lists the rules as they exist in your access rules policy, either all rules or just the ones you selected before generating the report. When you select a rule, the ACEs created on the device for that rule are listed in the expanded table in the lower half of the window. When you initially open the report, the expanded table shows the ACEs for all policies listed in the upper table.

Hit counts in the expanded table are for each ACE, whereas the count in the rules table is the sum of the hit counts for all ACEs created by the rule. Note that the expanded table for ASA/PIX/FWSM devices, and IOS devices lower than 12.4(20)T, shows hit counts for each element within any policy objects used in the rule, whereas for IOS 12.4(20)T+ devices, the information is only provided at the object group level.

- [Figure 16-3](#) shows the same ACEs in CLI format. These are the ACEs as they exist in the device configuration.

For more information about how to read and interpret hit count reports, see [Viewing Hit Count Details, page 16-33](#).

**Figure 16-2 Expanded Table**

Specific Rule Selected

The screenshot displays the 'Hit Count Query Results' window. At the top, there is an 'Info' section with 'Select Device: ios189' and a 'Refresh Hit Count' button. Below this is a table titled 'Selected Access Rules'. The second row of this table is highlighted with a red dashed border, indicating it is the selected rule. An arrow labeled 'Specific Rule Selected' points to this row. Below the table is a 'Choose:' dropdown menu set to 'Expand...'. At the bottom, another table titled 'Rule Results Expanded' shows the details for the selected rule. An arrow labeled 'Rule Results Expanded' points to this table. The number '144732' is visible in the bottom right corner of the window.

| Rule              | HitCount | Permit | Source     | Destination | Service     | Interface  | Dir. | Options     | Category |

## Importing Rules

Typically, when you add a device to Security Manager, you discover policies from the device. This action populates your access rules policy with the access control entries (ACEs) from all active ACLs on the device.

If you find there are other ACLs that have ACEs you want included in your policy, you can define them directly in Security Manager.

Another alternative, however, is to import them by copying and pasting the CLI entries from a device running-configuration, or by typing in the desired commands. Using the Import Rules wizard, you can quickly create ACEs and associated policy objects from ACLs that you know already work. You might also want to use this method if you are more comfortable using CLI commands to define your rules.

The following steps describe using the Import Rules wizard to add CLI-based rules and preview the results.

- Step 1** (Device view only) Select **Firewall > Access Rules** to open the [Access Rules Page, page 16-9](#).
- Step 2** Select the row after which you want to add the rules. The row must be within the Local scope. If you do not select a row, the rules are added at the end of the Local scope.
- Step 3** Right-click anywhere in the rules table and choose **Import Rules** to start the wizard. The first page—Enter Parameters—of the three-page wizard appears.

- Step 4** On the [Import Rules Wizard—Enter Parameters Page, page 16-38](#):
- Enter the desired CLI information in the *running-configuration* format appropriate for the selected device. For examples of importable CLI-based rules, see [Examples of Imported Rules, page 16-41](#).
  - Specify whether you are creating an interface-specific rule (and enter the interface or interface role to which you want the rules to apply), or for ASA 8.3+ devices, a global rule (see [Understanding Global Access Rules, page 16-3](#)).
  - Specify the traffic direction with respect to the interface (the direction is always In for global rules).

Beside access control rules, you should also include the CLI information for the following items if they are referred to by the rules. If you do not include these items, the named objects must already be defined in Security Manager for the import to be successful.

- Time range objects (the **time-range** command with its subcommands), which can create time range policy objects.
  - Object groups for PIX, ASA, FWSM, and IOS 12.4(20)T+ devices (the **object-group** command with its subcommands), which can create network/host policy objects.
- For ASA 8.3+ devices, you can also include the **object network** and **object service** commands. However, any object NAT configuration is not imported.

- Step 5** Click **Next** to process the rules and open the [Import Rules Wizard—Status Page, page 16-39](#).

You are notified if your CLI input contains errors when you click the Next button. For some detailed tips about what commands you can enter, see [Import Rules Wizard—Enter Parameters Page, page 16-38](#).

The CLI is evaluated and if importable, you are told the types of objects that were created from the CLI.

- Step 6** Click **Next** to view the rules and objects on the [Import Rules Wizard—Preview Page, page 16-40](#), or click **Finish** to import the rules without previewing them.

The information on the Preview page is read-only. If the rules are acceptable, click **Finish**.

If you want to make changes, you can click the **Back** button to return to the Enter Parameters page of the wizard, or you can click Finish and edit the rules on the Access Rules page.

## Import Rules Wizard—Enter Parameters Page

Use the Import Rules wizard to import a set of access control entries from an ACL in device running-configuration format to your access rules policy. The command syntax you can enter is controlled by the type of device to which you are importing rules.

Beside access control rules, you should also include the CLI for the following items if they are referred to by the rules. If you do not include these items, the named objects must already be defined in Security Manager for the import to be successful.

- Time range objects (the **time-range** command with its subcommands).
- Object groups for PIX, ASA, FWSM, and IOS 12.4(20)T devices (the **object-group** command with its subcommands).

For ASA 8.3+ devices, you can also include **object network** and **object service** commands. However, any object NAT configuration is not imported.

### Navigation Path

(Device view only) Right-click anywhere in the rules table on the [Access Rules Page, page 16-9](#) and choose **Import Rules**.

| CLI                            | <p>The OS commands that define the rules and related objects that you want to import. These rules must be in running-configuration format, so they are best copied and pasted from a configuration (use Ctrl+V to paste into the field). You can also type in the commands; you will be prompted if they cannot be interpreted.</p> <p>You can import only one ACL at a time.</p> <p>To see some examples of the CLI you can import, see <a href="#">Examples of Imported Rules, page 16-41</a>.</p> <p><b>Tips</b></p> <ul style="list-style-type: none"> <li>• If you refer to an object but do not include the CLI, the rule might be created but it will not use the object.</li> <li>• For PIX, FWSM, ASA, and IOS 12.4(20)T+, you can include object group and name commands.</li> <li>• If you import an ACL that is inactive, it is shown as disabled in Security Manager. If you deploy the configuration, it is removed from the device.</li> <li>• You can import extended ACLs for all device types, and standard ACLs for IOS devices. However, standard ACLs are converted to extended ACLs.</li> </ul> |
| Interface<br>Global (ASA 8.3+) | <p>Select whether you are importing an interface-specific or global rule. Global rules are available only for ASA 8.3+ devices, and are handled according to special rules (for detailed information, see <a href="#">Understanding Global Access Rules, page 16-3</a>).</p> <p>If you select <b>Interfaces</b>, enter the name of the interface or the interface role for which you are defining this rule, or click <b>Select</b> to select the interface or role from a list, or to create a new role. An interface must already be defined to appear on the list. You can enter any combination of interface or interface role names, separated by commas.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Traffic Direction              | The direction of the traffic with respect to the interface, in or out.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Category                       | The category assigned to the rules. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-12</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Import Rules Wizard—Status Page

Use the Status page of the Import Rules wizard to view information about the results of the import process.

| Rules Imported         | The number of rules that will be imported.                                                                                                                                                                                                                                                                                                                                                                         |
| Policy Objects Created | The number of policy objects that will be created.                                                                                                                                                                                                                                                                                                                                                                 |
| Messages               | The warning, error, and informational messages, as indicated by the severity icon. Typical informational messages describe the policy objects created during the operation or the existing policy objects that were reused.<br><br>When you select an item, the Description box to the right describes the message in detail. The Action box to the right provides information on how you can correct the problem. |
| Abort button           | Click this button to stop the import operation.                                                                                                                                                                                                                                                                                                                                                                    |

## Import Rules Wizard—Preview Page

Use the Preview page of the Import Rules wizard to view the rules and objects that will be imported if you click Finish.

This preview is read-only; you cannot edit the rules or objects. If the rules or objects are not exactly what you want, you can click Finish to add the rules and objects, and then edit them from the access rules page. For example, you cannot import rule expiration dates, because those dates have meaning only in Security Manager.

The tabs on this dialog box appear only if the data you are importing includes items to be displayed on the tab.

**Tip**

If your CLI refers to an object that does not exist, such as a time range, the object is not included in the rule. You can either go back and add the CLI for the object, or you can click Finish, create the object yourself, and edit the rule.

**Navigation Path**

| Objects tab | <p>The policy objects created from your CLI, if any. Depending on the CLI, Security Manager might create time range, network/host, service, or port list objects.</p> <p>Right-click an object and select <b>View Object</b> to see the object definition in read-only format.</p>                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Examples of Imported Rules

The following are some examples of CLI that you can import and the rules and policy objects that are created from them. For information on how to import rules, see [Importing Rules, page 16-37](#).

### Example 1: Restrict a network from accessing FTP servers (ASA devices)

The following access list uses object groups and restricts the 10.200.10.0/24 network from accessing some FTP servers. All other traffic is allowed.

```
object-group network ftp_servers
network-object host 172.16.56.195
network-object 192.168.1.0 255.255.255.224
access-list ACL_IN extended deny tcp 10.200.10.0 255.255.255.0 object-group ftp_servers
access-list ACL_IN extended permit ip any any
```

This example creates a network/host object named ftp\_servers and two access rules.

| No. | Permit | Source         | Destination | Service | Interface | Dir. | Category |
|-----|--------|----------------|-------------|---------|-----------|------|----------|
| 1   |        | 10.200.10.0/24 | ftp_servers | TCP     | Ethernet0 | in   | None     |
| 2   |        | any            | any         | IP      | Ethernet0 | in   | None     |

### Example 2: Restrict web access during working hours (ASA devices)

The following example denies HTTP requests between the hours of 8 AM and 6 PM, which are typical work hours.

```
time-range no-http
 periodic weekdays 8:00 to 18:00
access-list 101 deny tcp any any eq www time-range no-http
```

This example creates a time range object named no-http and one access rule.

| No. | Permit | Source | Destination | Service | Interface | Dir. | Options | Category |
|-----|--------|--------|-------------|---------|-----------|------|---------|----------|
| 1   |        | any    | any         | HTTP    | Ethernet0 | in   | no-http | None     |

### Example 3: Filtering on TCP and ICMP using port numbers (IOS devices)

In the following example, the first line of the extended access list named goodports permits any incoming TCP connections with destination ports greater than 1023. The second line permits incoming TCP connections to the Simple Mail Transfer Protocol (SMTP) port of host 172.28.1.2. The last line permits incoming ICMP messages for error feedback.

```
ip access-list extended goodports
 permit tcp any 172.28.0.0 0.0.255.255 gt 1023
 permit tcp any host 172.28.1.2 eq 25
 permit icmp any 172.28.0.0 255.255.255.255
```

This example creates three access rules. Notice that the wildcard masks used in the IOS ACL syntax are converted to regular subnet masks. Security Manager automatically converts between standard network/host subnet mask designations and the wildcard masks required in IOS ACLs. Because ASA/PIX/FWSM requires the use of subnet masks in ACL commands, this makes it possible for you to create rules that can apply to all devices; Security Manager takes care of converting your rules to the correct syntax.

| No. | Per... | Source | Destination   | Service     | Interface | Dir. | Category |
|-----|--------|--------|---------------|-------------|-----------|------|----------|
| 1   |        | any    | 172.28.0.0/16 | tcp/gt 1023 | Ethernet0 | in   | None     |
| 2   |        | any    | 172.28.1.2    | SMTP        | Ethernet0 | in   | None     |
| 3   |        | any    | any           | ICMP        | Ethernet0 | in   | None     |

### Example 4: Standard ACLs restricting hosts (IOS devices)

In the following example, the workstation belonging to Jones is allowed access to Ethernet interface 0 and the workstation belonging to Smith is not allowed access:

```
ip access-list standard workstations
 remark Permit only Jones workstation through
 permit 172.16.2.88
```

```
remark Do not allow Smith workstation through
deny 172.16.3.13
```

This example creates two rules, converting the standard rules to extended rules (to any destination). The remarks are saved in the description field.

| No. | Permit | Source      | Destination | Service | Interface | Dir. | Description       |
|-----|--------|-------------|-------------|---------|-----------|------|-------------------|
| 1   | ✓      | 172.16.2.88 | any         | IP      | Ethernet0 | in   | Permit only Jo... |
| 2   | ✗      | 172.16.3.13 | any         | IP      | Ethernet0 | in   | Do not allow 5... |

For more examples of ACLs in command language format, see the following:

Devices—[http://www.cisco.com/en/US/docs/ios/sec\\_data\\_plane/configuration/guide/sec\\_create\\_IP\\_apply.html#wp1027258](http://www.cisco.com/en/US/docs/ios/sec_data_plane/configuration/guide/sec_create_IP_apply.html#wp1027258).
- ASA  
Devices—[http://www.cisco.com/en/US/docs/security/asa/asa82/configuration/guide/acl\\_extended.html](http://www.cisco.com/en/US/docs/security/asa/asa82/configuration/guide/acl_extended.html).

## Optimizing Access Rules Automatically During Deployment

You can configure the system to optimize the access control lists (ACLs) that are created from your access rules policies when they are deployed to specific devices or to all devices. This optimization affects only the deployed policies, it does not make any changes to your access rules policy.

### Note

Optimization is not supported for ASA 9.x devices

Optimization removes redundancies and conflicts and can combine multiple entries (ACEs) into single entries. Although the order of entries might change, the semantics of your policies are preserved; the optimized ACL accepts or denies the same set of packets as did its unoptimized form. Following are the basic cases where changes are made:

- Ineffective ACE—Where one entry is a subset of, or equal to, another entry, the ineffective ACE is removed. Consider the following example:

```
access-list acl_mdc_inside_access deny ip host 10.2.1.1 any
access-list acl_mdc_inside_access deny ip 10.2.1.0 255.255.255.0 any
```

The first ACE is actually a subset of the second ACE. ACL optimization will deploy only the second entry.

- Superset ACE—Where one entry is a superset of another and the order of the rules does not matter, the redundant rule is removed. Consider the following example:

```
access-list acl_mdc_inside_access permit tcp any any range 110 120
access-list acl_mdc_inside_access deny tcp any any range 115
```

The second ACE will never be hit. ACL optimization will remove the second ACE and deploy only the first one.

- **Adjacent ACEs**—Where two entries are similar enough that a single entry can do the same job. There can be no intervening rules that change which packets will hit each rule. Consider the following example:

```
access-list myacl permit ip 1.1.1.0 255.255.255.128 any
access-list myacl permit ip 1.1.1.128 255.255.255.128 any
```

The two ACEs are merged into one: `access-list myacl permit ip 1.1.1.0 255.255.255.0 any`.

By configuring ACL deployment optimization, you can create smaller ACLs that are more efficient, which can improve performance on devices with limited, non-expandable memory, such as the FWSM, which can be shared among multiple virtual contexts.

However, there are down sides to configuring ACL deployment optimization:

- Because optimization changes what would normally be deployed for your access rules, it is hard to correlate those rules to the actual deployed ACEs. This can make the results of the hit count tool unusable, and make it very difficult to correlate events in the Cisco Security Monitoring, Analysis and Response System application. If it is important to you that you can monitor your access rules using these tools, do not enable optimization. For more information, see [Viewing Hit Count Details, page 16-33](#) and [Viewing CS-MARS Events for an Access Rule, page 69-28](#).
- Optimization does not address inherent problems in your access rules policy. It is typically better to address redundancies and conflicts proactively by using the automatic conflict detection tool (see [Using Automatic Conflict Detection, page 16-25](#)). You can also use the combine rules tool to optimize your rules in the access rules policy before you deploy them (see [Combining Rules, page 12-22](#)).

If you decide to configure ACL deployment optimization, consider enabling it only for those devices that are memory constrained.

---

**Step 1** Log into Windows on the Security Manager server.

**Step 2** Use a text editor such as NotePad to open the `C:\Program Files\CSCOpX\MDC\athena\config\csm.properties` file. Locate the optimization section and read the instructions.

- To turn on full optimization for all devices, enter the following:  
**OPTIMIZE.\*=full**
- To turn on full optimization for a specific device, replace the asterisk with the Security Manager display name for the device. For example, if the display name is `west_coast.cisco.com`, enter the following:  
**OPTIMIZE.west\_coast.cisco.com=full**
- To turn on optimization but preserve the object groups used in the ACE, replace the full keyword with `preserve_og`. For example:  
**OPTIMIZE.west\_coast.cisco.com=preserve\_og**
- If you do not want to allow the merger of adjacent entries, enter the following:  
**AclOptimization.doMerge=false**

**Step 3** Save the file. The settings take effect immediately and will be applied to all subsequent deployment jobs.

You can generate optimization reports for deployment jobs by selecting **Capture Discovery/Deployment Debugging Snapshots to File**, which is located in **Tools > Security Manager Administration > Debug Options**.

The deployment results will show optimization results summarized as an informational message that includes the original number of ACEs before optimization and the number of ACEs after optimization. The results are saved to a file on the server in the C:\Program Files\CSCOPx\MDC\temp folder. A job ID is used as part of the file name.

---

## CHAPTER 17

# Managing Firewall Inspection Rules

---

Inspection rules configure protocol inspection on a device. Inspection opens temporary holes in your access rules to allow return traffic for connections initiated within your trusted network. When traffic is inspected, the device also implements additional controls to eliminate mal-formed packets based on the inspected protocols.

The device commands generated for inspection rules vary based on device type. For devices running ASA, PIX 7.0+, and FWSM 3.x+, access-list, policy-map, and class-map commands are used. For older FWSM and PIX 6.3 devices, fixup commands are used. For IOS devices, ip-inspect commands are used.

The following topics will help you work with inspection rules:

- [Understanding Inspection Rules, page 17-1](#)

- [Editing Rules, page 12-9](#)
- [Enabling and Disabling Rules, page 12-20](#)
- [Moving Rules and the Importance of Rule Order, page 12-19](#)

## Understanding Inspection Rules

Inspection rules configure Context-Based Access Control (CBAC) inspection commands. CBAC inspects traffic that travels through the device to discover and manage state information for TCP and UDP sessions. The device uses this state information to create temporary openings to allow return traffic and additional data connections for permissible sessions.

CBAC creates temporary openings in access lists at firewall interfaces. These openings are created when inspected traffic exits your internal network through the firewall. The openings allow returning traffic (that would normally be blocked) and additional data channels to enter your internal network back through the firewall. The traffic is allowed back through the firewall only if it is part of the same session as the original traffic that triggered inspection when exiting through the firewall.

Inspection rules are applied after your access rules, so any traffic that you deny in the access rule is not inspected. The traffic must be allowed by the access rules at both the input and output interfaces to be inspected. Whereas access rules allow you to control connections at layer 3 (network, IP) or 4 (transport, TCP or UDP protocol), you can use inspection rules to control traffic using application-layer protocol session information.

For all protocols, when you inspect the protocol, the device provides the following functions:

- Automatically opens a return path for the traffic (reversing the source and destination addresses), so that you do not need to create an access rule to allow the return traffic. Each connection is considered a session, and the device maintains session state information and allows return traffic only for valid sessions. Protocols that use TCP contain explicit session information, whereas for UDP applications, the device models the equivalent of a session based on the source and destination addresses and the closeness in time of a sequence of UDP packets.

These temporary access lists are created dynamically and are removed at the end of a session.

- Tracks sequence numbers in all TCP packets and drops those packets with sequence numbers that are not within expected ranges.
- Uses timeout and threshold values to manage session state information, helping to determine when to drop sessions that do not become fully established. When a session is dropped, or reset, the device informs both the source and destination of the session to reset the connection, freeing up resources and helping to mitigate potential Denial of Service (DoS) attacks.

The following topics provide more information about inspection:

- [Choosing the Interfaces for Inspection Rules, page 17-2](#)
- [Selecting Which Protocols To Inspect, page 17-3](#)
- [Understanding Access Rule Requirements for Inspection Rules, page 17-4](#)

- [Configuring Protocols and Maps for Inspection, page 17-21](#)
- [Configuring Inspection Rules, page 17-5](#)
- [Configuring Settings for Inspection Rules for IOS Devices, page 17-88](#)

## Choosing the Interfaces for Inspection Rules

Configure inspection on devices that protect internal networks. Use it with TCP, UDP, or more specific protocols. Inspect these applications if you want the application's traffic to be permitted through the device only when the traffic session is initiated from a particular side of the device (usually from the protected internal network).

**Tip**

For IOS devices, you need to configure inspection explicitly, and you can identify the direction of traffic to be inspected. For ASA, PIX, and FWSM devices, you cannot identify the direction, and you need to configure inspection only if you do not want the inspection defaults. In the remaining discussion, statements concerning direction apply only to IOS devices. For ASA, PIX, and FWSM, simply configure inspection on the identified interface.

In many cases, you will configure inspection in one direction only at a single interface, which causes traffic to be permitted back into the internal network only if the traffic is part of a permissible (valid, existing) session. This is a typical configuration for protecting your internal networks from traffic that originates on the Internet.

You can also configure inspection in two directions at one or more interfaces. Configure inspection in two directions when the networks on both sides of the firewall should be protected, such as with extranet or intranet configurations, and to protect against DoS attacks. For example, if the device is situated between two partner companies' networks, you might want to restrict traffic in one direction for certain applications, and restrict traffic in the opposite direction for other applications. If you are protecting a web server in the DMZ zone, you might want to configure deep inspection on HTTP traffic to identify and reset connections that have undesirable characteristics.

You might want to configure your inspection rules on the outbound interfaces of your network, those that connect to the Internet or another uncontrolled network, while allowing unfiltered connections within the trusted network. Thus, your devices use resources for inspection only on sessions that travel over unsecured and therefore potentially dangerous networks.

## Selecting Which Protocols To Inspect

You can generically inspect TCP and UDP, which covers all applications that use these protocols. However, you can also inspect more specific protocols. In some cases, inspecting a specific protocol provides better service than generic TCP/UDP inspection. TCP and UDP inspection do not recognize application-specific commands, and therefore might not permit all return packets for an application, particularly if the return packets have a different port number than the previous exiting packet.

For example:

- Some protocols allow you to configure deep inspection. Deep inspection allows you to configure more specific rules for a traffic stream. For example, you can drop HTTP connections where the content type of the request and response do not match. For information on deep inspection and your configuration options, see [Configuring Protocols and Maps for Inspection, page 17-21](#).
- Protocols that negotiate return channels, such as FTP, should be specifically inspected. If you use simple generic TCP inspection of FTP traffic, the negotiated channels are not opened, and the connection will fail. If you want to allow FTP, ensure that you create a specific inspection rule for it.

Multimedia protocols also negotiate return channels and should be specifically inspected. These include H.323, RTSP (Real Time Streaming Protocol), and other application-specific protocols. Some applications also use a generic TCP channel, so you might also need to configure generic TCP inspection. Any generic TCP inspection rule should appear below a more specific inspection rule in the table (that is, any rule that specifies TCP or UDP should appear at the end of the inspection rule table).

## Understanding Access Rule Requirements for Inspection Rules

Access rules are applied before inspection rules. Therefore, you must ensure that your access rules do not prohibit traffic that you want inspected. Use the following guidelines:

- Permit inspected traffic to leave the network through the firewall.  
All access rules that evaluate traffic leaving the protected network should permit traffic that will be inspected. For example, if Telnet will be inspected, then Telnet traffic should be permitted on all access rules that apply to traffic leaving the network.
- Deny inspected return traffic entering the network through the firewall.  
For temporary openings to be created in an access list, the access list should deny inspected return traffic because the inspection engine will open up temporary holes in the access lists for this traffic. (You want traffic to be normally blocked when it enters your network.)
- Permit or deny traffic that cannot be inspected, or that you do not want to inspect, as required by your network.  
For example, if you do not want to inspect ICMP traffic, but you want to allow some ICMP traffic, configure your access rules to allow the traffic in both directions. Consider permitting at least these ICMP message types: echo reply (for ping commands), time-exceeded (for trace route), packet-too-big (for path MTU discovery), traceroute (for trace route), and unreachable (to notify that a host cannot be found).
- Add an access rule entry denying any network traffic from a source address matching an address on the protected network.  
This is known as anti-spoofing protection because it prevents traffic from an unprotected network from assuming the identity of a device on the protected network.
- Add an entry denying broadcast messages with a source address of 255.255.255.255.  
This entry helps to prevent broadcast attacks.

## Using Inspection To Prevent Denial of Service (DoS) Attacks on IOS Devices

Inspecting packets at the application layer, and maintaining TCP and UDP session information, provides a device with the ability to detect and prevent certain types of network attacks such as SYN-flooding. A SYN-flood attack occurs when a network attacker floods a server with a barrage of requests for connection and does not complete the connection. The resulting volume of half-open connections can overwhelm the server, causing it to deny service to valid requests. Network attacks that deny access to a network device are called denial-of-service (DoS) attacks.

Inspection helps to protect against DoS attacks in other ways. Inspection looks at packet sequence numbers in TCP connections to see if they are within expected ranges and drops any suspicious packets. You can also configure inspection to drop half-open connections, which require firewall processing and memory resources to maintain. Additionally, inspection can detect unusually high rates of new connections and issue alert messages.

For IOS devices, you can configure several inspection setting parameters to fine-tune your defenses against SYN flooding and half-open connections. Configure the **Firewall > Settings > Inspection** policy. For details about each setting, see [Configuring Settings for Inspection Rules for IOS Devices, page 17-88](#).

Inspection can also help by protecting against certain DoS attacks involving fragmented IP packets. Even though the firewall prevents an attacker from making actual connections to a given host, the attacker can disrupt services provided by that host. This is done by sending many non-initial IP fragments or by sending complete fragmented packets through a router with an ACL that filters the first fragment of a fragmented packet. These fragments can tie up resources on the target host as it tries to reassemble the incomplete packets. To fine-tune fragment inspection, configure an inspection rule for the **fragment** protocol and configure the maximum number of fragments you want to allow and a timeout value.

## Configuring Inspection Rules

Inspection rules policies identify the traffic that will be inspected through an interface. Inspection tracks permitted sessions and opens temporary holes in your access rules to allow return traffic.

Inspection rules are processed after access rules, so any traffic dropped by an access rule is not inspected. You can also use deny rules to selectively exclude certain types of traffic from inspection. For example, you might create a deny inspection rule to prevent a specific class of DNS traffic from being inspected, while all other DNS traffic is inspected. The basic procedure is:

- Add a new deny rule before the default inspection rule for the specific protocol. For the Match Traffic By option, select Source and Destination Address and Port. Next, define the specific type of traffic by providing Source and Destination Network IP addresses, and selecting the desired Service type (for example, DNS-TCP). Finally, in the third screen of the inspection-rule wizard, select the appropriate protocol (for example, DNS).
- Now edit the default inspection rule (below your new deny rule in the table). Again select Source and Destination Address and Port for the Match Traffic By option. Be sure this is a Permit rule, provide an all-addresses option as the source and destination addresses, and enter IP as the Service type. In the third screen, keep the selected protocol; configure or remove the related map, as necessary.

See [Inspection Rules Page, page 17-7](#) and [Add or Edit Inspect/Application FW Rule Wizard, page 17-10](#) for additional information about this process.

See the following topics for more information about things you should consider when creating inspection rules:

- [Understanding Inspection Rules, page 17-1](#)

- [Choosing the Interfaces for Inspection Rules, page 17-2](#)
- [Selecting Which Protocols To Inspect, page 17-3](#)
- [Understanding Access Rule Requirements for Inspection Rules, page 17-4](#)
- [Using Inspection To Prevent Denial of Service \(DoS\) Attacks on IOS Devices, page 17-4](#)
- [Configuring Protocols and Maps for Inspection, page 17-21](#)
- [Understanding Map Objects, page 6-72](#)

### Before You Begin

You might have a set of inspection rules that you want to apply to all devices. To do this, you can create a shared rule and inherit its rules to each device's inspection rules policy. For more information, see [Creating a New Shared Policy, page 5-51](#) and [Inheriting or Uninheriting Rules, page 5-43](#).

- 
- Step 1** Do one of the following to open the [Inspection Rules Page, page 17-7](#):
- (Device view) Select **Firewall > Inspection Rules** from the Policy selector.
  - (Policy view) Select **Firewall > Inspection Rules** from the Policy Type selector. Select an existing policy or create a new one.
- Step 2** Select the row after which you want to create the rule and click the **Add Row** button or right-click and select **Add Row**. This opens the [Add or Edit Inspect/Application FW Rule Wizard, page 17-10](#).

---

**Tip** If you do not select a row, the new rule is added at the end of the local scope. You can also select an existing row and edit either the entire row or specific cells. For more information, see [Editing Rules, page 12-9](#).

---

- Step 3** Select whether to apply the rule to all interfaces on the device or to only the interfaces you specify. If you elect to specify interfaces, enter the interface name or interface role, or click **Select** to select it from a list. For IOS devices, you also can select whether the rule applies in the Out direction (traffic leaving the interface). Use the In direction for all other device types.
- Step 4** Select the criteria you want to use for matching traffic. This determines what gets inspected based on this rule.
- **Default Protocol Ports**—Select this option if the protocol you are inspecting uses the default ports on your network.
 

If you want to constrain the inspection based on the source or destination address, also select **Limit inspection between source and destination IP addresses** (available only for ASA, PIX 7.x+, and FWSM 3.x+ devices). When you click **Next**, you are prompted for the source and destination addresses. You can specify **any** for source or destination if you are interested only in configuring the other value.
  - **Custom Destination Ports**—Select this option if you want to associate additional non-default TCP or UDP ports with a given protocol, for example, treating TCP traffic on destination port 8080 as HTTP traffic. When you click **Next**, you are prompted for the port or port range.
  - **Destination Address and Port (IOS devices only)**—Select this option if you want to associate additional non-default TCP or UDP ports with a given protocol only when the traffic is going to certain destinations, for example, if you want to treat TCP traffic on destination port 8080 as HTTP only when the traffic is going to server 192.168.1.10. When you click **Next**, you are prompted for the destination address and the port information.

- **Source and Destination Address and Port (PIX 7.x+, ASA, FWSM 3.x+)**—Select this option for the same reason you would select Destination Address and Port for IOS devices, although you have the additional option of identifying the source of the traffic. When you click **Next**, you are prompted for the source and destination addresses and the service port information.

**Note** For FWSM 2.x and PIX 6.3(x), you can select either Default Inspection Traffic or Custom Destination Ports only.

**Step 5** Click **Next**. If you selected anything other than Default Protocol Ports, fill in the required addressing and port information explained above and click **Next**. See [Add or Edit Inspect/Application FW Rule Wizard, Step 2, page 17-12](#).

**Step 6** On the [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page, page 17-16](#), select the protocol you want to inspect from the list. Ensure that the Device Type field indicates that inspection is supported for that protocol on the devices to which you are assigning the rule. (If you assign a rule to an unsupported device type, the rule is ignored but you will get a validation warning).

If the protocol you select allows additional configuration, the **Configure** button becomes active. Click it to view and select your options. For more information, see [Configuring Protocols and Maps for Inspection, page 17-21](#).

For IOS devices only:

- If you selected **Custom Destination Ports** or **Destination Address and Port** as the traffic match, you can select **custom protocol** as the protocol name and click **Configure** to assign a name to the configuration.
- You can configure additional alert, audit, and timeout settings that override those set in the inspection settings policy. You can also specify whether to inspect router generated traffic for a limited number of protocols. For more information about inspection settings, see [Configuring Settings for Inspection Rules for IOS Devices, page 17-88](#).

**Step 7** Click **Finish** to save the rule.

**Step 8** If you did not select the right row before adding the rule, select the new rule and use the up and down arrow buttons to position the rule appropriately. For more information, see [Moving Rules and the Importance of Rule Order, page 12-19](#).

## Inspection Rules Page

Use the Inspection Rules page to configure inspection rules for device interfaces. Inspection examines traffic that travels through the device to discover and manage state information for TCP and UDP sessions. The device uses this state information to create temporary openings to allow return traffic and additional data connections for permissible sessions.

**Note**

With the release of Security Manager 4.4 and versions 9.0 and higher of the ASA, the separate policies for configuring IPv4 and IPv6 inspection rules were unified. In Policy view, IPv4 and unified versions of the policy inspection type are provided. In addition, a utility that you can use to convert IPv4 policies is provided (see [Converting IPv4 Rules to Unified Rules, page 12-28](#)). The following descriptions apply to apply to all versions of the inspection rule table, except where noted.

**Note**

---

With the release of Security Manager 4.4 and versions 9.0 and higher of the ASA, the separate policies and objects for configuring IPv4 and IPv6 inspection rules were “unified,” meaning one set of inspection rules in which you can use either IPv4 or IPv6 addresses, or a mixture of both. (See [Policy Object Changes in Security Manager 4.4, page 1-9](#) for additional information.) In Policy view, IPv4 and unified versions of the inspection policy type are provided. In addition, a utility that you can use to convert existing IPv4 policies is provided (see [Converting IPv4 Rules to Unified Rules, page 12-28](#)). The following descriptions apply to all versions of the inspection rule table, except where noted.

---

Inspection rules are processed after your access rules. Thus, any traffic denied by an access rule is never inspected.

Read the following topics before you configure inspection rules:

- [Understanding Inspection Rules, page 17-1](#)
- [Choosing the Interfaces for Inspection Rules, page 17-2](#)
- [Selecting Which Protocols To Inspect, page 17-3](#)
- [Understanding Access Rule Requirements for Inspection Rules, page 17-4](#)
- [Using Inspection To Prevent Denial of Service \(DoS\) Attacks on IOS Devices, page 17-4](#)
- [Configuring Inspection Rules, page 17-5](#)

**Tip**

---

Disabled rules are shown with hash marks covering the table row. When you deploy the configuration, disabled rules are removed from the device. For more information, see [Enabling and Disabling Rules, page 12-20](#).

---

**Navigation Path**

To access the Inspection Rules page, do one of the following:

- (Device view) Select a device, then select **Firewall > Inspection Rules** from the Policy selector.
- (Policy view) Select **Firewall > Inspection Rules** from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click a device and select **Edit Firewall Policies > Inspection Rules**.

## Field Reference

Table 17-1 Inspection Rules Page

| Element                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Expand all rows/Collapse all rows | Use these buttons to expand or collapse all sections in the rules table.<br><b>Note</b> The buttons are located in the upper-right corner of the Filter area above the inspection rules table.                                                                                                                                                                                                                                                                                                                                                   |
| Conflict Indicator icons          | Identifies conflicts and provides a quick visual representation of the type of conflict. For more details, including types of conflicts and the actions you can take from this column, see <a href="#">Understanding the Automatic Conflict Detection User Interface, page 16-27</a> .                                                                                                                                                                                                                                                           |
| No.                               | The ordered rule number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Permit                            | Whether a rule identifies traffic that should be inspected based on the conditions set: <ul style="list-style-type: none"> <li>Permit—Identifies traffic that will be inspected. Shown as a green check mark.</li> <li>Deny—Exempts the traffic from inspection. Your access rules will determine if the traffic is allowed or blocked. Shown as a red circle with slash.</li> </ul>                                                                                                                                                             |
| Sources                           | The sources of traffic for this rule; can be networks, security groups (ASA 9.0+ only), and users. Multiple entries are displayed on separate lines within the table cell.                                                                                                                                                                                                                                                                                                                                                                       |
| Destinations                      | The destinations for this rule; can be networks and security groups (ASA 9.0+ only). Multiple entries are displayed on separate lines within the table cell.                                                                                                                                                                                                                                                                                                                                                                                     |
| Traffic Match                     | The type of matching used in the rule: <ul style="list-style-type: none"> <li><b>default-inspection</b>—The rule inspects traffic based on the default port.</li> <li>TCP,UDP/port number—The rule inspects traffic based on a custom port number.</li> <li>Service—The rule inspects traffic based on a service specification or service object. Multiple entries are displayed as separate subfields within the table cell. See <a href="#">Understanding and Specifying Services and Service and Port List Objects, page 6-86</a>.</li> </ul> |
| Interface                         | The interfaces or interface roles to which the rule is assigned. <b>Global</b> indicates that the rule is assigned to all interfaces. Interface role objects are replaced with the actual interface names when the configuration is generated for each device. Multiple entries are displayed as separate subfields within the table cell. See <a href="#">Understanding Interface Role Objects, page 6-67</a> .                                                                                                                                 |
| Dir.                              | The direction of the traffic to which this rule applies: <ul style="list-style-type: none"> <li>In—Packets entering the interface.</li> <li>Out—Packets exiting the interface.</li> </ul>                                                                                                                                                                                                                                                                                                                                                        |

**Table 17-1** *Inspection Rules Page (Continued)*

| Element                                   | Description                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Inspected Protocol                        | The protocol to be inspected and possibly some configuration settings for the protocol. You can right-click this cell and choose Edit Inspected Protocol to edit this; see <a href="#">Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page, page 17-16</a> for more information.                                                                                     |
| Time Range                                | The time range policy object assigned to the rule. This object defines the time window within which inspection occurs.                                                                                                                                                                                                                                                                   |
| Category                                  | The category assigned to the rule. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-12</a> .                                                                                                                                                                                                                                  |
| Description                               | The description of the rule, if any.                                                                                                                                                                                                                                                                                                                                                     |
| Last Ticket(s)                            | Shows the ticket(s) associated with last modification to the rule. You can click the ticket ID in the Last Ticket(s) column to view details of the ticket and to navigate to the ticket. If linkage to an external ticket management system has been configured, you can also navigate to that system from the ticket details (see <a href="#">Ticket Management Page, page 11-51</a> ). |
| Page elements below the rules table       |                                                                                                                                                                                                                                                                                                                                                                                          |
| Query                                     | Click this button to run a policy query, which can help you evaluate your rules and identify ineffective rules. See <a href="#">Generating Policy Query Reports, page 12-28</a>                                                                                                                                                                                                          |
| Find and Replace button (binoculars icon) | Click this button to search for various types of items within the table and to optionally replace them. See <a href="#">Finding and Replacing Items in Rules Tables, page 12-16</a> .                                                                                                                                                                                                    |
| Up Row and Down Row buttons (arrow icons) | Click these buttons to move the selected rules up or down within a scope or section. For more information, see <a href="#">Moving Rules and the Importance of Rule Order, page 12-19</a> .                                                                                                                                                                                               |
| Add Row button                            | Click this button to add a rule to the table after the selected row using the <a href="#">Add or Edit Inspect/Application FW Rule Wizard, page 17-10</a> . If you do not select a row, the rule is added at the end of the local scope. For more information about adding rules, see <a href="#">Adding and Removing Rules, page 12-9</a> .                                              |
| Edit Row button                           | Click this button to edit the selected rule. You can also edit individual cells. For more information, see <a href="#">Editing Rules, page 12-9</a> .                                                                                                                                                                                                                                    |
| Delete Row button                         | Click this button to delete the selected rule.                                                                                                                                                                                                                                                                                                                                           |

## Add or Edit Inspect/Application FW Rule Wizard

Use the Add or Edit Inspect/Application FW Rule wizard to add and edit inspection rules. The wizard steps you through the process of configuring an inspection rule based on your selection in the **Match Traffic By** group on this page.

Read the following topics before you configure inspection rules:

- [Understanding Inspection Rules, page 17-1](#)
- [Choosing the Interfaces for Inspection Rules, page 17-2](#)
- [Selecting Which Protocols To Inspect, page 17-3](#)

- [Understanding Access Rule Requirements for Inspection Rules, page 17-4](#)
- [Using Inspection To Prevent Denial of Service \(DoS\) Attacks on IOS Devices, page 17-4](#)
- [Configuring Inspection Rules, page 17-5](#)

### Navigation Path

From the [Inspection Rules Page, page 17-7](#), click the **Add Row** button or select a row and click the **Edit Row** button.

### Related Topics

- [Add or Edit Inspect/Application FW Rule Wizard, Step 2, page 17-12](#)
- [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page, page 17-16](#)
- [Understanding Interface Role Objects, page 6-67](#)

**Table 17-2** *Add and Edit Inspect/Application FW Rule Wizard Step 1: Traffic Match Method*

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Rule       | Whether to enable the rule, which means the rule becomes active when you deploy the configuration to the device. Disabled rules are shown overlain with hash marks in the rule table. For more information, see <a href="#">Enabling and Disabling Rules, page 12-20</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Apply the Rule to | <p>The interface to which the rule applies:</p> <ul style="list-style-type: none"> <li>• All Interfaces—Apply the rule to all interfaces. The rule becomes a global rule on ASA, PIX, and FWSM devices. For IOS devices, the rule is configured for each interface in the In direction.</li> <li>• Interface (PIX 7.x+, ASA, FWSM 3.x+, IOS)—Apply the rule only to those interfaces identified in the Interfaces field. Enter the name of the interface or the interface role, or click <b>Select</b> to select the interface or role from a list, or to create a new role. An interface must already be defined to appear on the list.</li> </ul> <p>For IOS devices only, you can select the direction of the traffic to which this rule applies, either traffic entering an interface (<b>In</b>) or exiting it (<b>Out</b>). For other devices, leave <b>In</b> as the direction.</p> |

### Match Traffic By

How you want to identify the traffic to inspect. If you select something other than Default Protocol Ports (by itself), you are prompted for the other port or address information when you click **Next**.

**Table 17-2 Add and Edit Inspect/Application FW Rule Wizard Step 1: Traffic Match Method**

| Element                                                                                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Default Protocol Ports<br>Limit inspection between source and destination IP addresses (PIX 7.x+, ASA, FWSM 3.x+) | <p>Inspect traffic based on the default ports assigned to a protocol. You will select a protocol on the next page (<a href="#">Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page, page 17-16</a>).</p> <p>You can also select <b>Limit inspection between source and destination IP addresses</b> to configure the inspection to occur only between a specified source and destination. Do not select this option if you want to inspect a protocol without applying any constraints to the inspected traffic.</p> <p>If you also select this option, the next page of the wizard is described in <a href="#">Add or Edit Inspect/Application FW Rule Wizard, Step 2, page 17-12</a>.</p> |
| Custom Destination Ports                                                                                          | <p>Inspect traffic based on specified non-default TCP or UDP destination ports. Select this option if you want to associate additional TCP or UDP traffic with a given protocol, for example, treating TCP traffic on destination port 8080 as HTTP traffic.</p> <p>You will specify the protocol and port(s) on the next page of the wizard; see <a href="#">Add or Edit Inspect/Application FW Rule Wizard, Step 2, page 17-12</a>.</p>                                                                                                                                                                                                                                                                       |
| Destination Address and Port (IOS devices only)                                                                   | <p>Inspect traffic on IOS devices based on destination IP address and port. Select this option if you want to associate additional non-default TCP or UDP ports with a given protocol only when the traffic is going to certain destinations, for example, if you want to treat TCP traffic on destination port 8080 as HTTP only when the traffic is going to server 192.168.1.10.</p>                                                                                                                                                                                                                                                                                                                         |
| Source and Destination Address and Port (PIX 7.x, ASA, FWSM 3.x)                                                  | <p>Inspect traffic on PIX 7.x+, ASA, and FWSM 3.x+ devices based on source and destination IP addresses and services. Select this option for the same reason you would select Destination Address and Port for IOS devices, although you have the additional option of identifying the source of the traffic.</p> <p>You will specify the action, sources, destinations, and Services on the next page of the wizard; see <a href="#">Add or Edit Inspect/Application FW Rule Wizard, Step 2, page 17-12</a>.</p>                                                                                                                                                                                               |
| Category                                                                                                          | <p>The category assigned to the rule. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-12</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Description                                                                                                       | <p>An optional description of the rule (up to 1024 characters).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Add or Edit Inspect/Application FW Rule Wizard, Step 2

The options presented on the second page of the Inspect/Application FW Rule Wizard depend on your **Match Traffic By** selection on the first page (see [Add or Edit Inspect/Application FW Rule Wizard, page 17-10](#)). The possibilities are as follows:

- If you select Default Protocol Ports on the first page and *do not* select Limit inspection between source and destination IP addresses, the second page consists of the options described in [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page, page 17-16](#).

- If you select Default Protocol Ports on the first page and *do* select Limit inspection between source and destination IP addresses, the second page consists of the options described in the second table in this section. (The third page will consist of the options described in [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page, page 17-16.](#))
- If you select Custom Destination Ports on the first page, the second page consists of the options described in the first table in this section. (The third page will consist of the options described in [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page, page 17-16.](#))
- If you select Source and Destination Address and Port on the first page, the second page consists of the options described in the second table in this section. (The third page will consist of the options described in [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page, page 17-16.](#))

### Navigation Path

From the [Add or Edit Inspect/Application FW Rule Wizard, page 17-10](#), select a Match Traffic By option and click Next.

### Field Reference

The following table describes the options presented on page 2 of the Inspect/Application FW Rule Wizard after you have selected **Custom Destination Ports** on the first page of the wizard (described in [Add or Edit Inspect/Application FW Rule Wizard, page 17-10](#)).

**Table 17-3 Add and Edit Inspect/Application FW Rule Wizard Step 2: Protocol and Port Page**

| Element  | Description                                                                                                                                                                   |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocol | The protocol for the ports you are specifying, either TCP, UDP, or both TCP/UDP.<br><br>When configuring Custom Destination Ports for an IOS device, you must select TCP/UDP. |

**Table 17-3 Add and Edit Inspect/Application FW Rule Wizard Step 2: Protocol and Port Page**

| Element | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ports   | <p>The port(s) used by the traffic you want to inspect. Valid values range from 1 to 65535.</p> <ul style="list-style-type: none"> <li>• Single—Specify one port number only.</li> <li>• Range—Specify a range of ports, for example, 10000-11000.</li> </ul> <p>When configuring custom ports, be aware that port ranges might not be supported on all platforms or OS versions. Any conflicts are identified during policy validation, not while you are editing this rule.</p> <p><b>Tip</b> If you specify a port or port range that conflicts with a pre-defined port mapping, the device does not allow the port to be remapped.</p> |

The following table describes the options presented on page 2 of the Inspect/Application FW Rule Wizard after you have selected **Default Protocol Ports** and **Limit inspection between source and destination IP addresses** on the first page of the wizard, and when you select **Source and Destination Address and Port** on the first page. The first page of the wizard is described in [Add or Edit Inspect/Application FW Rule Wizard, page 17-10](#).

**Table 17-4 Add and Edit Inspect/Application FW Rule Wizard Step 2: Action, Sources, Destinations, and Services Page**

| Element | Description                                                                                                                                                                                                                                                                                                                                                                 |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action  | <p>Whether you are identifying traffic that should be inspected based on the conditions set. Typically, you will create Permit rules.</p> <ul style="list-style-type: none"> <li>• Permit—Identifies traffic that will be inspected.</li> <li>• Deny—Exempts the traffic from inspection. Your access rules will determine if the traffic is allowed or blocked.</li> </ul> |

**Table 17-4 Add and Edit Inspect/Application FW Rule Wizard Step 2: Action, Sources, Destinations, and Services Page (Continued)**

| Element | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sources | <p>Provide traffic sources for this rule; can be networks, security groups, and users. You can enter values or object names, or Select objects, for one or more of the following types of sources:</p> <ul style="list-style-type: none"> <li>• Network – You can specify a various network, host and interface definitions, either individually or as objects. If you Select an interface object as a source, the dialog box displays tabs to differentiate between hosts/networks and interfaces.</li> </ul> <p>The “All-Address” objects do not restrict the rule to specific hosts, networks, or interfaces. These addresses are IPv4 or IPv6 addresses for hosts or networks, network/host objects, interfaces, or interface roles.</p> <p><b>Note</b> You can only specify a fully qualified domain name (FQDN) by providing an FQDN network/host object, or a group object that includes an FQDN object. You cannot directly type in an FQDN.</p> <p>See <a href="#">Understanding Networks/Hosts Objects, page 6-74</a>, <a href="#">Specifying IP Addresses During Policy Definition, page 6-81</a> and <a href="#">Understanding Interface Role Objects, page 6-67</a> for additional information about these definitions.</p> <ul style="list-style-type: none"> <li>• Security Groups (ASA 9.0+) – Enter or Select the name or tag number for one or more source security groups for the rule, if any. See <a href="#">Selecting Security Groups in Policies, page 14-13</a>, <a href="#">Configuring TrustSec-Based Firewall Rules, page 14-13</a> and <a href="#">Creating Security Group Objects, page 14-12</a> for more information about security groups.</li> <li>• Users – Enter or Select the Active Directory (AD) user names, user groups, or identity user group objects for the rule, if any. You can enter any combination of the following: <ul style="list-style-type: none"> <li>– Individual user names: NetBIOS_DOMAIN\username</li> <li>– User groups (note the double \):<br/>NetBIOS_DOMAIN\user_group</li> <li>– Identity user group object names.</li> </ul> <p>For more information, see:</p> <ul style="list-style-type: none"> <li>– <a href="#">Selecting Identity Users in Policies, page 13-21</a></li> <li>– <a href="#">Configuring Identity-Based Firewall Rules, page 13-21</a></li> <li>– <a href="#">Creating Identity User Group Objects, page 13-19</a></li> </ul> </li> </ul> <p><b>Note</b> Enter more than one value in any of these fields by separating the items with commas.</p> <p>Each specification is combined with any others to limit traffic matches to only those flows that include all definitions. For example, specified user traffic originating from within a specified source address range.</p> |

**Table 17-4 Add and Edit Inspect/Application FW Rule Wizard Step 2: Action, Sources, Destinations, and Services Page (Continued)**

| Element      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Destinations | Provide traffic destinations for this rule; can be networks or security groups. As with Sources, you can enter values or object names, or Select objects, for one or more destinations of Network and Security Group (ASA 9.0+) type.                                                                                                                                                                                                          |
| Services     | The services that define the type of traffic upon which to act. You can enter or Select any combination of service objects and service types (which are typically a protocol and port combination).<br><br>Enter more than one value by separating the items with commas.<br><br>For complete information on how to specify services, see <a href="#">Understanding and Specifying Services and Service and Port List Objects</a> , page 6-86. |
| Time Range   | The name of a time range policy object that defines the times when this rule applies. The time is based on the system clock of the device. The feature works best if you use NTP to configure the system clock.<br><br>Enter the name or click <b>Select</b> to select the object. If the object that you want is not listed, click the <b>Create</b> button to create it.                                                                     |

## Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page

Use the Inspect/Application FW Rule wizard's inspected protocol page to configure the protocol monitored by this inspection rule.

The options in this section are presented when you add or edit a firewall inspection rule, and when you right-click the Inspected Protocol cell of an existing rule in the table on the [Inspection Rules Page](#), page 17-7.

### Navigation Path

Do one of the following:

- In the [Add or Edit Inspect/Application FW Rule Wizard](#), page 17-10, click Next until you reach this page.
- To open the Edit Inspected Protocols dialog box, right-click the Inspected Protocol cell of an inspection rule and choose **Edit Inspected Protocol**. If you select multiple rows, your changes replace the inspected protocol defined for all selected rules.

| Element                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocols table                       | <p>Lists the protocols that can be inspected. You can select one protocol per rule. The list includes information on the device operating systems that allow inspection of the protocol: do not select protocols that are not supported by the device type to which you will apply the inspection rule.</p> <p><b>Tip</b> For IOS devices, if you selected Custom Destination Ports or Destination Address and Port for the match type on the first page of the wizard, you can select <b>custom protocol</b> and click Configure to give your protocol a name. For other device types, select the protocol that you associate with the ports previously specified.</p> <p>The Options column displays configured options for the selected protocol, if any.</p> <p>The Group column provides additional information on the use of some of the protocols.</p>                                                                                                                                                                |
| Selected Protocol<br>Configure button | <p>Displays the protocol you selected. If the protocol allows additional configuration, the Configure button becomes active; click it to see your options, and click the Help button in the dialog box that is opened for information about the options. For more information about protocols that allow configuration, see <a href="#">Configuring Protocols and Maps for Inspection, page 17-21</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Rule Settings (IOS)                   | <p>Additional settings for the rule if it is used on devices running Cisco IOS software. If you select Use Default Inspection settings, the IOS defaults, or the settings defined in the inspection settings policy (see <a href="#">Configuring Settings for Inspection Rules for IOS Devices, page 17-88</a>), are used. These are the settings you can enable or disable:</p> <ul style="list-style-type: none"> <li>• Alert—Whether to generate stateful packet inspection alert messages on the console.</li> <li>• Audit—Whether audit trail messages are logged to the syslog server or router.</li> <li>• Timeout—Whether to configure the length of time, in seconds, for which a session is managed while there is no activity. If you select Specify Timeout, enter the timeout value; the range is 5 to 43200 seconds.</li> <li>• Inspect Router Generated Traffic—Whether to inspect traffic that is generated by the device itself. This option is available for a limited number of the protocols.</li> </ul> |

## Configure DNS Dialog Box

Use the Configure DNS dialog box to configure settings for DNS inspection on PIX 7.0+, ASA, FWSM, and IOS devices.

### Navigation Path

Go to the [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page, page 17-16](#), select DNS in the protocols table, and click **Configure**.

### Field Reference

**Table 17-6** Configure DNS Dialog Box

| Element                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maximum DNS Packet Length      | The maximum DNS packet length. Values are 512 to 65535.                                                                                                                                                                                                                                                                                                                                                                         |
| DNS Map                        | The DNS policy map object that defines traffic match conditions and actions, protocol conformance policies, and filter settings. Enter the object name, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it.                                                                                                                                            |
| Enable Dynamic Filter Snooping | Whether to allow the security appliance to snoop DNS packets in order to build a database of DNS lookup information. This information is used by botnet traffic filtering to match DNS names to IP addresses.<br><br>If you configure a botnet traffic filtering rules policy, select this option. Otherwise, do not select the option. For more information, see <a href="#">Botnet Traffic Filter Rules Page, page 19-9</a> . |

## Configure SMTP Dialog Box

Use the SMTP dialog box to edit settings for Simple Mail Transfer Protocol (SMTP) inspection. SMTP is used to transfer email between servers and clients on the Internet.

SMTP inspection drops any packets with illegal commands. You can configure a maximum data length for packets. Enter a length in the range 0-4294967295.

### Navigation Path

Go to the [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page, page 17-16](#), select SMTP in the protocols table, and click **Configure**.

## Configure ESMTP Dialog Box

Use the Configure ESMTP dialog box to edit settings for Extended Simple Mail Transport Protocol (ESMTP) inspection. You can configure these settings based on platform:

- IOS devices—You can configure a maximum data length for packets. Enter a length in the range 0-4294967295.
- ASA/PIX 7.x+ devices—You can specify an ESMTP policy map object to define deep inspection parameters. Enter the name of the object or click **Select** to select it from a list or to create a new object.

**Navigation Path**

Go to the [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page, page 17-16](#), select ESMTP in the protocols table, and click **Configure**.

**Configure Fragments Dialog Box**

Use the Configure Fragments dialog box to edit settings for fragment inspection on IOS devices.

**Navigation Path**

Go to the [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page, page 17-16](#), select fragment in the protocols table, and click **Configure**.

**Field Reference**

**Table 17-7** *Configure Fragments Dialog Box*

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maximum Fragments | <p>The maximum number of unassembled packets for which state information (structures) is allocated by Cisco IOS software. Unassembled packets are packets that arrive at the router interface before the initial packet for a session. Values are 0-10000 state entries. The default is 256.</p> <p><b>Note</b> Memory is allocated for the state structures, and setting this value to a larger number may cause memory resources to be exhausted.</p> |
| Timeout (sec)     | <p>The number of seconds that a packet state structure remains active. When the timeout value expires, the router drops the unassembled packet, freeing that structure for use by another packet. Values are 1-1000. The default timeout value is one second.</p>                                                                                                                                                                                       |

**Configure IMAP or POP3 Dialog Boxes**

Use the Configure IMAP or POP3 dialog boxes to edit settings for Internet Message Access Protocol (IMAP) or Post Office Protocol 3 (POP3) inspection on IOS devices.

- IMAP is a method for accessing electronic mail or bulletin board messages that are kept on a mail server that may be shared. It permits a client email program to access remote messages as though they were local.
- POP3 is used to receive email that is stored on a mail server. Unlike IMAP, POP retrieves mail only from a remote host.

**Navigation Path**

Go to the [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page, page 17-16](#), select IMAP or POP3, and click **Configure**.

**Field Reference****Table 17-8** *Configure IMAP or POP3 Dialog Boxes*

| Element                                      | Description                                                                                                                                                                                    |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Reset Connection on Invalid IMAP/POP3 packet | Whether to reset, or drop, the connection between the client and server if an invalid packet is encountered. The client will have to repeat the validation process to reconnect to the server. |
| Enforce Secure Authentication                | Whether to require that the client use a secure login to the server, that is, so that passwords are not sent in clear text.                                                                    |

**Configure RPC Dialog Box**

Use the RPC dialog box to edit settings for RPC inspection on IOS devices. RPC inspection blocks traffic for all RPC programs except for those you specify. To allow more than one RPC program, create a rule for each program number you want to allow.

**Navigation Path**

Go to the [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page, page 17-16](#), select RPC in the protocols table, and click **Configure**.

**Field Reference****Table 17-9** *Configure RPC Dialog Box*

| Element        | Description                                                                                                                                                                                                    |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Program Number | The program number to permit. Values are 1-4294967295.                                                                                                                                                         |
| Wait Time      | The number of minutes to keep a hole in the firewall open to allow subsequent connections from the same source address to the same destination address and port. Values are 0-35791 minutes. The default is 0. |

**Custom Protocol Dialog Box**

Use the Custom Protocol dialog box to assign a name to the protocol and port specification you made on the [Add or Edit Inspect/Application FW Rule Wizard, Step 2, page 17-12](#) for IOS devices.

**Navigation Path**

Go to the [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page, page 17-16](#), select custom protocol in the protocols table, and click **Configure**.

**Configure Dialog Box**

Use the Configure dialog box to select a policy map object for HTTP or IM inspection. The maps used for these types of inspection differ depending on the operating system version used on the device. Select the desired version and then click **Select** to select the desired policy map object or to create a new one.

**Navigation Path**

Go to the [Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page, page 17-16](#), select HTTP or IM in the protocols table, and click **Configure**.

## Configuring Protocols and Maps for Inspection

When you configure inspection rules for a device, you select the protocols that you want to inspect. Some of these protocols allow additional configuration for deep inspection. Deep inspection allows you to specify additional requirements that packets must meet in order to traverse the device. For example, you can drop HTTP connections where the content type of the request and response do not match. (For a full list of inspectable protocols, click **Add Row** on the Inspection Rule page and click Next to view the protocols list.)

What you can configure depends not only on the protocol but on the device's operating system and version number. Typically, your ability to fine-tune inspection is higher on an ASA device compared to an IOS device. (If you are configuring an IOS device and you want greater control over inspection, consider configuring zone-based firewall inspection; for more information, see [Understanding the Zone-based Firewall Rules, page 21-3](#).)

Some deep inspection configuration is done directly in the inspection rule. However, for some protocols, you can configure the inspection rule to include a policy map that you create as an independent policy object. (You need to configure policy maps only if you want something other than the default inspection options.) You can configure these maps from the policy object selector dialog box while configuring the policy, or from the Policy Object Manager window (select **Manage > Policy Objects**).

For protocols that use policy maps, you can select the desired policy map, which defines the match conditions for the targeted traffic. For ASA, PIX, and FWSM devices, these policy maps might point to class maps that define the match conditions. To create these policy maps in the Policy Object Manager, select one of the maps listed in the following table in the **Maps > Policy Maps > Inspect** folder and review the detailed usage information in the references mentioned. For information on creating class maps, which are in the **Maps > Class Maps > Inspect** folder, see the references to the match criterion dialog boxes and [Configuring Class Maps for Inspection Policies, page 17-26](#).

**Table 17-10** Configuring Protocols for Deep Inspection in Inspection Rules

| Protocol                 | Device Types        | Policy Map             | Class Map (ASA, PIX, FWSM only) | Description and Match Criteria Reference                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------|---------------------|------------------------|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DNS                      | ASA, PIX, FWSM, IOS | DNS                    | DNS                             | Inspect traffic based on a wide variety of criteria using the class and policy map, which allow extensive control over DNS packets. In addition, you can configure a maximum length in the inspection rule, and enable dynamic DNS snooping for use with Botnet rules (on ASA devices). See the following topics: <ul style="list-style-type: none"> <li>• <a href="#">Configuring DNS Maps, page 17-28</a></li> <li>• <a href="#">DNS Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes, page 17-31</a></li> <li>• <a href="#">Configure DNS Dialog Box, page 17-18</a></li> </ul> |
| FTP Strict               | ASA, PIX, FWSM, IOS | FTP                    | FTP                             | Inspect traffic based on file name, type, server, user, or FTP command. See <a href="#">Configuring FTP Maps, page 17-37</a> and <a href="#">FTP Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes, page 17-38</a> .                                                                                                                                                                                                                                                                                                                                                                |
| GTP                      | ASA, PIX, FWSM, IOS | GTP                    | GTP                             | Inspect traffic based on timeout values, message sizes, tunnel counts, and GTP versions traversing the security appliance. See <a href="#">Configuring GTP Maps, page 17-40</a> and <a href="#">GTP Policy Maps Add or Edit Match Condition and Action Dialog Boxes, page 17-43</a> .                                                                                                                                                                                                                                                                                                                         |
| H.323 H.225<br>H.323 RAS | ASA, PIX, FWSM      | H.323 (ASA, PIX, FWSM) | H.323 (ASA, PIX, FWSM)          | Inspect traffic based on a wide variety of criteria, including the H.323 message type, calling party, and called party. See <a href="#">Configuring H.323 Maps, page 17-45</a> and <a href="#">H.323 Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes, page 17-48</a> .                                                                                                                                                                                                                                                                                                            |

**Table 17-10** Configuring Protocols for Deep Inspection in Inspection Rules (Continued)

| Protocol | Device Types                  | Policy Map                                                              | Class Map (ASA, PIX, FWSM only) | Description and Match Criteria Reference                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

See <a href="#">Configuring SIP Maps</a> , page 17-77 and <a href="#">SIP Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes</a> , page 17-79.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Skinny   | ASA, PIX, FWSM, IOS           | Skinny                                                                  | (none)                          | Inspect traffic based on a wide variety of criteria. See <a href="#">Configuring Skinny Maps</a> , page 17-81 and <a href="#">Skinny Policy Maps Add or Edit Match Condition and Action Dialog Boxes</a> , page 17-83.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| SMTP     | ASA, PIX 7.x+, FWSM 3.x+, IOS | (none)                                                                  | (none)                          | Inspect Simple Mail Transfer Protocol (SMTP) traffic and drop any that use illegal commands. You can configure a maximum data length for packets. See <a href="#">Configure SMTP Dialog Box</a> , page 17-18.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| SNMP     | ASA, PIX, FWSM 3.x+, IOS      | SNMP                                                                    | (none)                          | Inspect SNMP traffic based on SNMP version. See <a href="#">Configuring SNMP Maps</a> , page 17-84.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

Table 17-10 Configuring Protocols for Deep Inspection in Inspection Rules (Continued)

| Protocol           | Device Types                  | Policy Map         | Class Map (ASA, PIX, FWSM only) | Description and Match Criteria Reference                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------|-------------------------------|--------------------|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NetBIOS            | ASA, PIX 7.x+, FWSM           | NetBIOS            | (none)                          | Inspect NetBIOS traffic to translate IP addresses in the NetBIOS name service (NBNS) packets according to the security appliance NAT configuration. You can drop packets that violate the protocol. See <a href="#">Configuring NetBIOS Maps, page 17-75</a> .                                                                                                                                                                              |
| IPSec Pass Through | ASA, PIX 7.x+                 | IPsec Pass Through | (none)                          | Inspect IPSec traffic and control whether ESP or AH traffic is allowed. See <a href="#">Configuring IPSec Pass Through Maps, page 17-74</a> .                                                                                                                                                                                                                                                                                               |
| DCE/RPC            | ASA 7.2+, PIX 7.2+, FWSM 3.2+ | DCE/RPC            | (none)                          | Inspect traffic based on timeouts and enforcing the mapper service. See <a href="#">Configuring DCE/RPC Maps, page 17-27</a> .                                                                                                                                                                                                                                                                                                              |
| IP options         | ASA 8.2(2)+                   | IP Options         | (none)                          | Allow IP packets that have certain options configured in the Options section of the IP header. In routed mode, packets that contain the router-alert option are allowed. Otherwise, if any option is set, packets are dropped. IP options are unnecessary for most communication, but the NOP (no operation) option might be used for padding, so you might want to allow it. See <a href="#">Configuring IP Options Maps, page 17-68</a> . |
| IPv6               | ASA 8.4(2)+                   | IPv6               | (none)                          | Inspect IPv6 traffic based on the following types of extension headers found anywhere in an IPv6 packet: Hop-by-Hop Options, Routing (Type 0), Fragment, Destination Options, Authentication, and Encapsulating Security Payload. See <a href="#">Configuring IPv6 Maps, page 17-70</a> and <a href="#">IPv6 Policy Maps Add or Edit Match Condition and Action Dialog Boxes, page 17-71</a> .                                              |

**Table 17-10** Configuring Protocols for Deep Inspection in Inspection Rules (Continued)

| Protocol                                                                 | Device Types                  | Policy Map                          | Class Map (ASA, PIX, FWSM only) | Description and Match Criteria Reference                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------------------------------------------|-------------------------------|-------------------------------------|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ESMTP                                                                    | ASA, PIX 7.x+, FWSM 3.x+, IOS | ESMTP                               | (none)                          | Inspect ESMTP traffic. For IOS, you can configure only maximum data length. For ASA, PIX, FWSM, you can inspect traffic based on a wide variety of criteria. See <a href="#">Configuring ESMTP Maps</a> , page 17-34.                                                                                                                                                                                                                                              |
| Fragment                                                                 | IOS                           | (none)                              | (none)                          | Inspect traffic based on a maximum allowed number of unassembled packet fragments. See <a href="#">Configure Fragments Dialog Box</a> , page 17-19.                                                                                                                                                                                                                                                                                                                |
| IMAP (Internet Message Access Protocol)<br>POP3 (Post Office Protocol 3) | IOS                           | (none)                              | (none)                          | Inspect traffic based on invalid commands or clear text logins. See <a href="#">Configure IMAP or POP3 Dialog Boxes</a> , page 17-19.                                                                                                                                                                                                                                                                                                                              |
| RPC (Sun Remote Procedure Call)                                          | FWSM 2.x, IOS                 | (none)                              | (none)                          | Inspect traffic based on the RPC protocol number. See <a href="#">Configure RPC Dialog Box</a> , page 17-20.                                                                                                                                                                                                                                                                                                                                                       |
| IM                                                                       | ASA, PIX 7.x+, IOS            | IM (ASA 7.2+, PIX 7.2+)<br>IM (IOS) | IM (only for ASA, PIX)          | Inspect traffic based on a wide variety of criteria. The allowed maps differ based on operating system version.<br><br><b>For ASA, PIX</b> , see <a href="#">Configuring IM Maps for ASA 7.2+, PIX 7.2+ Devices</a> , page 17-64 and <a href="#">IM Class and Policy Map (ASA 7.2+/PIX 7.2+) Add or Edit Match Condition (and Action) Dialog Boxes</a> , page 17-65.<br><br><b>For IOS</b> , see <a href="#">Configuring IM Maps for IOS Devices</a> , page 17-67. |

## Configuring Class Maps for Inspection Policies

Use the Add and Edit Class Map dialog boxes to define class maps to be used in policy maps of the same type. The name of the dialog box indicates the type of map you are creating.

A class map defines application traffic based on criteria specific to the application. You then select the class map in the corresponding policy map and configure the action to take for the selected traffic. Thus, each class map must contain traffic that you want to handle in the same way (for example, to allow it or to drop it).

When configuring inspection rules for devices running ASA/PIX 7.2 or higher, or FWSM, you can create class maps for the inspection of the following types of traffic: DNS, FTP, H.323, HTTP, IM, SIP, and ScanSafe.

You can also define class criteria in the related policy map. However, creating class maps allows you to reuse the map in multiple policy maps.

The following topics describe the available match criteria:

- [DNS Class and Policy Maps Add or Edit Match Condition \(and Action\) Dialog Boxes, page 17-31](#)
- [FTP Class and Policy Maps Add or Edit Match Condition \(and Action\) Dialog Boxes, page 17-38](#)
- [H.323 Class and Policy Maps Add or Edit Match Condition \(and Action\) Dialog Boxes, page 17-48](#)
- [HTTP Class and Policy Map \(ASA 7.2+/PIX 7.2+\) Add or Edit Match Condition \(and Action\) Dialog Boxes, page 17-59](#)
- [IM Class and Policy Map \(ASA 7.2+/PIX 7.2+\) Add or Edit Match Condition \(and Action\) Dialog Boxes, page 17-65](#)
- [SIP Class and Policy Maps Add or Edit Match Condition \(and Action\) Dialog Boxes, page 17-79](#)

### Navigation Path

Select **Manage > Policy Objects**, then select DNS, FTP, H.323 (ASA/PIX/FWSM), HTTP (ASA/PIX/FWSM), IM, or SIP (ASA/PIX/FWSM) in the **Maps > Class Maps > Inspect** folder in the table of contents. Right-click inside the work area, then select **New Object**, or right-click a row, then select **Edit Object**.

## Configuring DCE/RPC Maps

Use the Add or Edit DCE/RPC Map dialog boxes to define a map for DCE/RPC inspection. A DCE/RPC inspection policy map lets you change the default configuration values used for DCE/RPC inspection.

DCE/RPC is a protocol widely used by Microsoft distributed client and server applications that allows software clients to execute programs on a server remotely.

This typically involves a client querying a server called the Endpoint Mapper listening on a well-known port number for the dynamically allocated network information of a required service. The client then sets up a secondary connection to the server instance providing the service. The security appliance allows the appropriate port number and network address and also applies NAT, if needed, for the secondary connection.

DCE/RPC inspection maps inspect for native TCP communication between the EPM and client on well-known TCP port 135. Map and lookup operations of the EPM are supported for clients. Client and server can be located in any security zone. The embedded server IP address and port number are received from the applicable EPM response messages. Because a client may attempt multiple connections to the server port returned by EPM, multiple use of pinholes are allowed, which have user configurable timeouts.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > DCE/RPC** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

A maximum of 40 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Description                                                     | A description of the policy object. A maximum of 200 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                |
| Pinhole Timeout                                                 | The timeout for DCE/RPC pinholes. The default is 2 minutes (00:02:00). Valid values are between 00:00:01 and 1193:00:00.                                                                                                                                                                                                                                                                                                                                                                   |
| Enforce Endpoint Mapper Service                                 | Whether to enforce the endpoint mapper service during binding. Using this service, a client queries a server, called the Endpoint Mapper, for the dynamically allocated network information of a required service.                                                                                                                                                                                                                                                                         |
| Enable Endpoint Mapper Service Lookup<br>Service Lookup Timeout | Whether to enable the lookup operation of the endpoint mapper service. If you select this option, you can enter the time out for the lookup operation. If you do not specify a timeout, the pinhole timeout or default pinhole timeout value is used. Valid values are between 00:00:01 and 1193:00:00.                                                                                                                                                                                    |
| Category                                                        | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-12</a> .                                                                                                                                                                                                                                                                                                                                  |
| Allow Value Override per Device<br>Overrides<br>Edit button     | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-17</a> .<br><br>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object. |

## Configuring DNS Maps

Use the Add and Edit DNS Map dialog boxes to define DNS Maps for inspection. A DNS map lets you change the default configuration values used for DNS application inspection.

DNS application inspection supports DNS message controls that provide protection against DNS spoofing and cache poisoning. You can configure rules for certain DNS types to be allowed, dropped, or logged, while others are blocked. For example, you can restrict zone transfer between servers.

The Recursion Desired and Recursion Available flags in the DNS header can be masked to protect a public server from attack if that server only supports a particular internal zone. In addition, DNS randomization can be enabled to avoid spoofing and cache poisoning of servers that either do not support randomization or that use a weak pseudo random number generator. Limiting the domain names that can be queried protects the public server further.

You can configure a DNS mismatch alert as notification if an excessive number of mismatching DNS responses are received, which could indicate a cache poisoning attack.

**Navigation Path**

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > DNS** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

**Field Reference****Table 17-13 Add and Edit DNS Map Dialog Boxes**

| Element     | Description                                                                 |
|-------------|-----------------------------------------------------------------------------|
| Name        | The name of the policy object. A maximum of 40 characters is allowed.       |
| Description | A description of the policy object. A maximum of 200 characters is allowed. |

**Protocol Conformance Tab**

Defines DNS security settings and actions. For a description of the options on this tab, see [DNS Map Protocol Conformance Tab, page 17-30](#).

**Filtering Tab**

Defines the filtering settings for DNS. For a description of the options on this tab, see [DNS Map Filtering Tab, page 17-30](#).

**Mismatch Rate Tab**

The **Log When DNS ID Mismatch Rate Exceeds** option determines whether you want to report excessive instances of DNS identifier mismatches based on the following criteria:

- **Threshold**—The maximum number of mismatch instances before a system message log is sent. Values are 0 to 4294967295.
- **Time Interval**—The time period to monitor (in seconds). Values are 1 to 31536000.

**Match Condition and Action Tab**

The Match All table lists the criteria included in the policy map. Each row indicates whether the inspection is looking for traffic that matches or does not match each criterion, the criterion and value that is inspected, and the action to be taken for traffic that satisfies the conditions.

- To add a criterion, click the Add button and fill in the Match Condition and Action dialog box (see [DNS Class and Policy Maps Add or Edit Match Condition \(and Action\) Dialog Boxes, page 17-31](#)).
- To edit a criterion, select it and click the Edit button.
- To delete a criterion, select it and click the Delete button.

| Drop Packets Sent to Client that Exceed Length Indicated by Resource Record        | Whether to drop packets sent to the client that exceed the length indicated by the resource record.         |

## DNS Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes

Use the Add or Edit DNS Match Criterion (for DNS class maps) or Match Condition and Action (for DNS policy maps) dialog boxes to do the following:

- Define the match criterion and value for a DNS class map.
- Select a DNS class map when creating a DNS policy map.
- Define the match criterion, value, and action directly in a DNS policy map.

The fields on this dialog box change based on the criterion you select and whether you are creating a class map or policy map.

**Navigation Path**

When creating a DNS class map, in the Policy Object Manager, from the Add or Edit Class Maps dialog boxes for DNS, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring Class Maps for Inspection Policies, page 17-26](#).

When creating a DNS policy map, in the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit DNS Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring DNS Maps, page 17-28](#).

| Element                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Value<br>(for DNS Type criterion)               | <p>The DNS type you want to inspect:</p> <ul style="list-style-type: none"> <li>• DNS Type Field Name—Matches the name of a DNS type: <ul style="list-style-type: none"> <li>- A—IPv4 address.</li> <li>- AXFR—Full (zone) transfer.</li> <li>- CNAME—Canonical name.</li> <li>- IXFR—Incremental (zone) transfer.</li> <li>- NS—Authoritative name server.</li> <li>- SOA—Start of a zone of authority.</li> <li>- TSIG—Transaction signature.</li> </ul> </li> <li>• DNS Type Field Value—Matches the specified number.</li> <li>• DNS Type Field Range—Matches the specified range of numbers.</li> </ul>                                                                                                                                        |
| Value<br>(for Domain Name criterion)            | <p>The regular expression you want to evaluate. You can select one of the following:</p> <ul style="list-style-type: none"> <li>• Regular Expression—The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression object.</li> <li>• Regular Expression Group—The regular expression group object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression group object.</li> </ul> |
| Options<br>Value<br>(for Header Flag criterion) | <p>The header flag you want to inspect. Use the Options field to indicate whether you want an exact match (Equals) or a partial match (Contains).</p> <ul style="list-style-type: none"> <li>• Header Flag Name—Matches the selected header flag names: <ul style="list-style-type: none"> <li>- AA (authoritative answer)</li> <li>- QR (query)</li> <li>- RA (recursion available)</li> <li>- RD (recursion denied)</li> <li>- TC (truncation) flag bits</li> </ul> </li> <li>• Header Flag Value—Matches the specified 16-bit hexadecimal value.</li> </ul>                                                                                                                                                                                      |
| Resource Record                                 | <p>Lists the sections to match:</p> <ul style="list-style-type: none"> <li>• Additional—DNS additional resource record.</li> <li>• Answer—DNS answer resource record.</li> <li>• Authority—DNS authority resource record.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Configuring ESMTP Maps

Use the Add and Edit ESMTP Map dialog boxes to define the match criterion and values for the ESMTP inspect map. An ESMTP policy map lets you change the default configuration values used for ESMTP inspection.

ESMTP inspection detects attacks, including spam, phishing, malformed message attacks, and buffer overflow/underflow attacks. It also provides support for application security and protocol conformance, which enforce the sanity of the ESMTP messages as well as detect several attacks, block senders/receivers, and block mail relay.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > ESMTP** from the Object Type selector. Right-click inside the table, then select **New Object** or right-click a row and select **Edit Object**.

| Category                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-12</a> .                                                                                                              |
| Allow Value Override per Device                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-17</a> . |
| Overrides                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                                                                                                                        |
| Edit button                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                           |

## ESMTP Policy Maps Add or Edit Match Condition and Action Dialog Boxes

Use the Add or Edit Match Condition and Action dialog boxes to define the match criterion, value, and action for an ESMTP policy map.

The fields on this dialog box change based on the criterion you select. You can use the following criteria:

- Body Length—Matches the message body length.
- Body Line Length—Matches the length of a line in the message body.
- Commands—Matches ESMTP commands.
- Command Recipient Count—Matches the number of recipient email addresses.
- Command Line Length—Matches the number of characters of a command line.
- EHLO Reply Parameters—Matches the ESMTP EHLO reply parameters.
- Header Length—Matches the number of characters of the header.
- Header Line Length—Matches the number of characters of a line in the message header.
- To Recipients Count—Matches the number of recipients in the To field of the header.
- Invalid Recipients Count—Matches the number of invalid recipients in the header.
- MIME File Type—Matches the MIME file type.
- MIME Filename Length—Matches the number of characters of the filename.
- MIME Encoding—Matches the MIME encoding scheme.
- Sender Address—Matches the address of the sender.
- Sender Address Length—Matches the number of characters of the sender's address.

**Navigation Path**

In the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit ESMTP Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring ESMTP Maps, page 17-34](#).

**Field Reference**

**Table 17-18** *ESMTP Policy Maps Add and Edit Match Condition and Action Dialog Boxes*

| Element   | Description                                                                                                                                                                                                                                                                                                                                                                      |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criterion | Specifies which criterion of ESMTP traffic to match. The criteria are described above.                                                                                                                                                                                                                                                                                           |
| Type      | Specifies whether the map includes traffic that matches or does not match the criterion. For example, if Doesn't Match is selected on the string "example.com," then any traffic that contains "example.com" is excluded from the map. <ul style="list-style-type: none"> <li>• Matches—Matches the criterion.</li> <li>• Doesn't Match—Does not match the criterion.</li> </ul> |
| Action    | The action you want the device to take for traffic that matches the defined criteria.                                                                                                                                                                                                                                                                                            |

**Variable Fields**

The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see.

|                     |                                                                                                                                                                                                                                                                                                                                  |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Greater Than Length | The length in bytes of the evaluated field. The criterion matches if the length is greater than the specified number, and does not match if the field is less than the specified number.<br><br>The dialog box indicates the valid range for the length, except for Body Length and Header length, which can be 1 to 4294967295. |
| Commands            | The ESMTP command verbs you want to inspect.                                                                                                                                                                                                                                                                                     |
| Greater Than Count  | The number of evaluated items. The criterion matches if the count is greater than the specified number, and does not match if the count is less than the specified number.                                                                                                                                                       |
| Parameters          | The ESMTP EHLO reply parameters you want to inspect.                                                                                                                                                                                                                                                                             |

**Table 17-18** *ESMTP Policy Maps Add and Edit Match Condition and Action Dialog Boxes*

| Element       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Value         | <p>The regular expression you want to evaluate. You can select one of the following:</p> <ul style="list-style-type: none"> <li>• <b>Regular Expression</b>—The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression object.</li> <li>• <b>Regular Expression Group</b>—The regular expression group object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression group object.</li> </ul> |
| MIME Encoding | The type of MIME encoding schemes you want to inspect.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Configuring FTP Maps

Use the Add and Edit FTP Map dialog boxes to define the match criterion and values for an FTP inspect map. You can use an FTP map to block specific FTP protocol methods, such as an FTP PUT, from passing through the security appliance and reaching your FTP server.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > FTP** from the Object Type selector. Right-click inside the table, then select **New Object** or right-click a row, then select **Edit Object**.

| <p>The Match All table lists the criteria included in the policy map. Each row indicates whether the inspection is looking for traffic that matches or does not match each criterion, the criterion and value that is inspected, and the action to be taken for traffic that satisfies the conditions.</p> <ul style="list-style-type: none"> <li>To add a criterion, click the Add button and fill in the Match Condition and Action dialog box (see <a href="#">FTP Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes, page 17-38</a>).</li> <li>To edit a criterion, select it and click the Edit button.</li> <li>To delete a criterion, select it and click the Delete button.</li> </ul> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Category                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-12</a> .                                                                                                                                                                                                                                                                                                                                        |
| Allow Value Override per Device Overrides Edit button                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <p>Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-17</a>.</p> <p>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.</p> |
| Validate For Validate button                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | The device platforms for which to validate the object. Select the platform for which you intend to use this object and click <b>Validate</b> to determine if the object is configured in a way that will prevent policy deployment.                                                                                                                                                                                                                                                              |

## FTP Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes

Use the Add or Edit FTP Match Criterion (for FTP class maps) or Match Condition and Action (for FTP policy maps) dialog boxes to do the following:

- Define the match criterion and value for an FTP class map.
- Select an FTP class map when creating an FTP policy map.
- Define the match criterion, value, and action directly in an FTP policy map.

The fields on this dialog box change based on the criterion you select and whether you are creating a class map or policy map.

### Navigation Path

When creating an FTP class map, in the Policy Object Manager, from the Add or Edit Class Maps dialog boxes for FTP, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring Class Maps for Inspection Policies, page 17-26](#).

When creating an FTP policy map, in the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit FTP Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring FTP Maps, page 17-37](#).

| <b>Element</b>                                | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Match Type<br>Class Name<br>(Policy Map only) | Enables you to use an existing FTP class map or define a new FTP class map. <ul style="list-style-type: none"> <li>• Use Specified Values—You want to define the class map on this dialog box.</li> <li>• Use Values in Class Map—You want to select an existing FTP class map policy object. Enter the name of the FTP class map in the <b>Class Name</b> field. Click <b>Select</b> to select the map from a list or to create a new class map object.</li> </ul> |
| Criterion                                     | Specifies which criterion of FTP traffic to match: <ul style="list-style-type: none"> <li>• Request Command—Matches an FTP request command.</li> <li>• Filename—Matches a filename for FTP transfer.</li> <li>• File Type—Matches a file type for FTP transfer.</li> <li>• Server—Matches an FTP server name.</li> <li>• Username—Matches an FTP username.</li> </ul>                                                                                               |
| Type                                          | Specifies whether the map includes traffic that matches or does not match the criterion. For example, if Doesn't Match is selected on the string "example.com," then any traffic that contains "example.com" is excluded from the map. <ul style="list-style-type: none"> <li>• Matches—Matches the criterion.</li> <li>• Doesn't Match—Does not match the criterion.</li> </ul>                                                                                    |
| Action<br>(Policy Map only)                   | The action you want the device to take for traffic that matches the defined criteria.                                                                                                                                                                                                                                                                                                                                                                               |

**Variable Fields**

The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see.

**Table 17-20** FTP Class and Policy Maps Add and Edit Match Condition and Action Dialog Boxes

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Request Commands | <p>The FTP commands you want to inspect:</p> <ul style="list-style-type: none"> <li>• Append (APPE)—Appends to a file.</li> <li>• Delete (DELE)—Deletes a file at the server site.</li> <li>• Help (HELP)—Provides help information from the server.</li> <li>• Put (PUT)—FTP client command for the stor (store a file) command.</li> <li>• Rename From (RNFR)—Specifies rename-from filename.</li> <li>• Server Specific Command (SITE)—Specifies commands that are server specific. Usually used for remote administration.</li> <li>• Change to Parent (CDUP)—Changes to the parent directory of the current working directory.</li> <li>• Get (GET)—FTP client command for the retr (retrieve a file) command.</li> <li>• Create Directory (MKD)—Creates a directory.</li> <li>• Remove Directory (RMD)—Removes a directory.</li> <li>• Rename To (RNTO)—Specifies rename-to filename.</li> <li>• Store File with Unique Name (STOU)—Stores a file with a unique filename.</li> </ul> |
| Value            | <p>The regular expression you want to evaluate. You can select one of the following:</p> <ul style="list-style-type: none"> <li>• Regular Expression—The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression object.</li> <li>• Regular Expression Group—The regular expression group object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression group object.</li> </ul>                                                                                                                                                                                                                                        |

## Configuring GTP Maps

Use the Add and Edit GTP Map dialog boxes to define the match criterion and values for a GTP inspect map.

The GPRS Tunnel Protocol (GTP) provides uninterrupted connectivity for mobile subscribers between GSM networks and corporate networks or the Internet. GTP uses a tunneling mechanism to provide a service for carrying user data packets.

A GTP map object lets you change the default configuration values used for GTP application inspection. The GTP protocol is designed to provide security for wireless connections to TCP/IP networks such as the Internet. You can use a GTP map to control timeout values, message sizes, tunnel counts, and GTP versions traversing the security appliance.

**Tip**

GTP inspection requires a special license. If you do not have the required license, you will see device errors if you try to deploy a GTP map.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > GTP** from the Object Type selector. Right-click inside the work area, then select **New Object**, or right-click a row and select **Edit Object**.

| Name                            | The name of the policy object. A maximum of 40 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Description                     | A description of the policy object. A maximum of 200 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Parameters tab</b>           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Country and Network Codes Table | The three-digit Mobile Country Code (mcc) and Mobile Network Code (mnc) to include in the map. The codes are 000 to 999. <ul style="list-style-type: none"> <li>• To add codes, click the Add button and fill in the dialog box.</li> <li>• To edit a row, select it and click the Edit button.</li> <li>• To delete a row, select it and click the Delete button.</li> </ul>                                                                                                                            |
| Permit Response Table           | The Network/Host policy objects for which you will allow GTP responses from a GSN that is different from the one to which the response was sent. <ul style="list-style-type: none"> <li>• To add objects, click the Add button and fill in the dialog box. For more information, see <a href="#">Add and Edit Permit Response Dialog Boxes, page 17-42</a>.</li> <li>• To edit a row, select it and click the Edit button.</li> <li>• To delete a row, select it and click the Delete button.</li> </ul> |
| Request Queue                   | The maximum requests allowed in the queue. When the limit has been reached and a new request arrives, the request that has been in the queue for the longest time is removed. Values are 1-9999999. The default is 200.                                                                                                                                                                                                                                                                                  |
| Tunnel Limit                    | The maximum number of tunnels allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 17-21 Add and Edit GTP Map Dialog Boxes (Continued)**

| Element              | Description                                                                                                                                                                  |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Permit Errors        | Whether to permit packets with errors or different GTP versions. By default, all invalid packets or packets that failed during parsing are dropped.                          |
| Edit Timeouts button | Click this button to configure time out values for various operations. For more information about the options, see <a href="#">GTP Map Timeouts Dialog Box, page 17-43</a> . |

**Match Condition and Action Tab**

The Match All table lists the criteria included in the policy map. Each row indicates whether the inspection is looking for traffic that matches or does not match each criterion, the criterion and value that is inspected, and the action to be taken for traffic that satisfies the conditions.

- To add a criterion, click the Add button and fill in the Match Condition and Action dialog box (see [GTP Policy Maps Add or Edit Match Condition and Action Dialog Boxes, page 17-43](#)).
- To edit a criterion, select it and click the Edit button.
- To delete a criterion, select it and click the Delete button.

|                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Category                                              | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-12</a> .                                                                                                                                                                                                                                                                                                                              |
| Allow Value Override per Device Overrides Edit button | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-17</a> .<br>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object. |
| Validate For Validate button                          | The device platforms for which to validate the object. Select the platform for which you intend to use this object and click <b>Validate</b> to determine if the object is configured in a way that will prevent policy deployment.                                                                                                                                                                                                                                                    |

**Add and Edit Country Network Codes Dialog Boxes**

Use the Add and Edit Country Network Codes dialog boxes to add Mobile Country Code (mcc) and Mobile Network Code (mnc) values to the GTP policy map. The codes can be 000 to 999.

**Navigation Path**

From the Add and Edit GTP Map dialog boxes, click the **Add** button in the Country and Network codes table, or select a row and click the **Edit** button. See [Configuring GTP Maps, page 17-40](#).

**Add and Edit Permit Response Dialog Boxes**

Use the Add and Edit Permit Response dialog boxes to permit GTP responses from a GSN that is different from the one to which the response was sent.

Enter the name of a Network/Host policy object that defines the destination (**To Object Group**) and source (**From Object Group**) of the traffic. You can click **Select** to select the object from a list, where you can also create a new object by clicking the **Create** button in the Object Selector dialog box.

You cannot use the Network/Host object named “any.”

#### Navigation Path

From the Add and Edit GTP Map dialog boxes, click the **Add** button in the Permit Response table, or select a row and click the **Edit** button. See [Configuring GTP Maps, page 17-40](#).

## GTP Map Timeouts Dialog Box

Use the GTP Map Timeouts dialog box to set timeout values for a GTP Map.

#### Navigation Path

From the Add and Edit GTP Map dialog boxes, click the **Edit Timeouts** button on the Parameters tab. See [Configuring GTP Maps, page 17-40](#).

#### Field Reference

**Table 17-22 GTP Map Timeouts Dialog Box**

| Element                       | Description                                                                                                                                                                                         |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GSN Timeout                   | The period of inactivity (hh:mm:ss) after which a GSN is removed. The default is 30 minutes. Enter 0 to never tear down immediately.                                                                |
| PDP Context Timeout           | The maximum period of time allowed (hh:mm:ss) before beginning to receive the PDP context. The default is 30 minutes. Enter 0 to specify no limit.                                                  |
| Request Queue Timeout         | The maximum period of time allowed (hh:mm:ss) before beginning to receive the GTP message. The default is 60 seconds. Enter 0 to specify no limit.                                                  |
| Signaling Connections Timeout | The period of inactivity (hh:mm:ss) after which the GTP signaling is removed. The default is 30 minutes. Enter 0 to not remove the signal.                                                          |
| Tunnel Timeout                | The period of inactivity (hh:mm:ss) after which the GTP tunnel is torn down. The default is 60 seconds (when a Delete PDP Context Request is not received). Enter 0 to never tear down immediately. |
| T3 Response Timeout           | The maximum wait time for a response before removing the connection.                                                                                                                                |

## GTP Policy Maps Add or Edit Match Condition and Action Dialog Boxes

Use the Add or Edit Match Condition and Action dialog boxes to define the match criterion, value, and action for a GTP policy map.

The fields on this dialog box change based on the criterion you select.

#### Navigation Path

In the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit GTP Map dialog box, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring GTP Maps, page 17-40](#).

### Field Reference

**Table 17-23** GTP Policy Maps Add and Edit Match Condition and Action Dialog Boxes

| Element   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criterion | <p>Specifies which criterion of GTP traffic to match:</p> <ul style="list-style-type: none"> <li>• Access Point Name—Matches the access point name so you can define the access points to drop when GTP application inspection is enabled.</li> <li>• Message ID—Matches the numeric identifier for the message that you want to drop. By default, all valid message IDs are allowed.</li> <li>• Message Length—Matches the length of the UDP packet. Use this criterion to change the default for the maximum allowed message length for the UDP payload.</li> <li>• Version—Matches the GTP version.</li> </ul> |
| Type      | <p>Specifies whether the map includes traffic that matches or does not match the criterion. For example, if Doesn't Match is selected on the string "example.com," then any traffic that contains "example.com" is excluded from the map.</p> <ul style="list-style-type: none"> <li>• Matches—Matches the criterion.</li> <li>• Doesn't Match—Does not match the criterion.</li> </ul>                                                                                                                                                                                                                           |
| Action    | <p>The action you want the device to take for traffic that matches the defined criteria.</p> <ul style="list-style-type: none"> <li>• Drop Packet—By default, all invalid packets or packets that failed during parsing are dropped.</li> <li>• Drop Packet and Log</li> <li>• Rate Limit</li> </ul>                                                                                                                                                                                                                                                                                                              |

### Variable Fields

The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see.

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Access Point Name | <p>The access points to act on when GTP application inspection is enabled.</p> <ul style="list-style-type: none"> <li>• Specified By—An access point name to be dropped. By default, all messages with valid APNs are inspected, and any APN is allowed.</li> <li>• Regular Expression—The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression object.</li> <li>• Regular Expression Group—The regular expression group object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression group object.</li> </ul> |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Table 17-23** GTP Policy Maps Add and Edit Match Condition and Action Dialog Boxes (Continued)

| Element        | Description                                                                                                                                                                                                                     |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ID Type        | The numeric identifier of the message that you want to act on. <ul style="list-style-type: none"> <li>Value—A single message ID.</li> <li>Range—A range of message IDs.</li> </ul>                                              |
| Minimum Length | The minimum number of bytes in the UDP payload.                                                                                                                                                                                 |
| Maximum Length | The maximum number of bytes in the UDP payload.                                                                                                                                                                                 |
| Version Type   | The GTP version as a single value or range of values.<br><br>Use 0 to identify Version 0 and 1 to identify Version 1. Version 0 of GTP uses port 2123, while Version 1 uses port 3386. By default all GTP versions are allowed. |

## Configuring H.323 Maps

Use the Add and Edit H.323 Map dialog boxes to define the match criterion and values for an H.323 inspect map. An H.323 policy map lets you change the default configuration values used for H.323 inspection.

H.323 inspection supports H.323 compliant applications such as Cisco CallManager and VocalTec Gatekeeper. H.323 is a suite of protocols defined by the International Telecommunication Union for multimedia conferences over LANs. The security appliance supports H.323 through Version 4, including H.323 v3 feature Multiple Calls on One Call Signaling Channel.

With H.323 inspection enabled, the security appliance supports multiple calls on the same call signaling channel, a feature introduced with H.323 Version 3. This feature reduces call setup time and reduces the use of ports on the security appliance. The two major functions of H.323 inspection are as follows:

- NAT the necessary embedded IPv4 addresses in the H.225 and H.245 messages. Because H.323 messages are encoded in PER encoding format, the security appliance uses an ASN.1 decoder to decode the H.323 messages.
- Dynamically allocate the negotiated H.245 and RTP/RTCP connections.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > H.323 (ASA/PIX/FWSM)** from the Object Type selector. Right-click inside the work area, then select **New Object**, or right-click a row and select **Edit Object**.

| Description                                                     | A description of the policy object. A maximum of 200 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Parameters tab</b>                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| HSI Group table                                                 | <p>The HSI groups to include in the map. The group number, IP address of the HSI host, and IP addresses and interface names of the clients connected to the security appliance are shown in the table. Up to five HSI hosts per group, and up to ten end points per HSI group, are allowed.</p> <ul style="list-style-type: none"> <li>To add a group, click the Add button and fill in the dialog box (see <a href="#">Add or Edit HSI Group Dialog Boxes, page 17-47</a>).</li> <li>To edit a group, select it and click the Edit button.</li> <li>To delete a group, select it and click the Delete button.</li> </ul> |
| Call Duration Limit                                             | The call duration limit in seconds. The range is from 0:0:0 to 1163:0:0. A value of 0 means never timeout.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Enforce Presence of Calling and Called Party Numbers            | Whether to enforce calling and called party numbers used in call setup.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Check State Transition on H.225 Messages                        | Whether to enable state checking validation on H.225 messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Check State Transition on RAS Messages                          | Whether to enable state checking validation on RAS messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Create Pinholes on Seeing RCF Packets                           | <p>Whether to enable call setup between H.323 endpoints when the Gatekeeper is inside the network. The device opens pinholes for calls based on Registration Request/Registration Confirm (RRQ/RCF) messages. Because these RRQ/RCF messages are sent to and from the Gatekeeper, the calling endpoint's IP address is unknown and the device opens a pinhole through source IP address/port 0/0.</p> <p>This option is available for ASA 8.0(5)+ devices.</p>                                                                                                                                                            |
| Check for H.245 Tunneling Action                                | Whether to enforce H.245 tunnel blocking and perform the action you select in the Action list box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Check RTP Packets for Protocol Conformance                      | Whether to check RTP packets flowing through the pinholes for protocol conformance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Payload Type must be Audio or Video based on Signaling Exchange | Whether to enforce the payload type to be audio or video based on the signaling exchange.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Category                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-12</a> .                                                                                                                                                                                                                                                                                                                                        |
| Allow Value Override per Device Overrides Edit button                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <p>Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-17</a>.</p> <p>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.</p> |

## Add or Edit HSI Group Dialog Boxes

Use the Add or Edit HSI group dialog boxes to add HSI groups to an H.323 policy inspection map.

### Navigation Path

From the Parameters tab on the Add and Edit H.323 Map dialog boxes, click the **Add Row** button in the HSI group table, or select a row and click the **Edit Row** button. See [Configuring H.323 Maps, page 17-45](#).

### Field Reference

**Table 17-25 Add and Edit HSI Group Dialog Boxes**

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Group ID       | The HSI group ID number (0 to 2147483647).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| IP Address     | The IP address of the HSI host.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Endpoint table | <p>The end points associated with HSI group. You can add up to 10 end points per group. For each end point, you specify the IP address and interface policy group.</p> <ul style="list-style-type: none"> <li>To add an end point, click the Add button and fill in the dialog box (see <a href="#">Add or Edit HSI Endpoint IP Address Dialog Boxes, page 17-48</a>).</li> <li>To edit an end point, select it and click the Edit button.</li> <li>To delete an end point, select it and click the Delete button.</li> </ul> |

## Add or Edit HSI Endpoint IP Address Dialog Boxes

Use the Add or Edit HSI Endpoint IP Address dialog box to add end points to an HSI group.

### Navigation Path

From the Add and Edit HSI Group dialog boxes, click the **Add Row** button in the end point table, or select a row and click the **Edit Row** button. See [Configuring H.323 Maps, page 17-45](#).

### Field Reference

**Table 17-26 Add and Edit HSI Endpoint IP Address Dialog Boxes**

| Element      | Description                                                                                                                                                                                                                   |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Network/Host | The IP address of the end point host or network.                                                                                                                                                                              |
| Interface    | The Interface policy group that identifies the interface connected to the security appliance. Enter the name of a policy group, or click <b>Select</b> to select it from a list, where you can also create new policy groups. |

## H.323 Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes

Use the Add or Edit H.323 Match Criterion (for H.323 class maps) or Match Condition and Action (for H.323 policy maps) dialog boxes to do the following:

- Define the match criterion and value for an H.323 class map.
- Select an H.323 class map when creating an H.323 policy map.
- Define the match criterion, value, and action directly in an H.323 policy map.

The fields on this dialog box change based on the criterion you select and whether you are creating a class map or policy map.

### Navigation Path

When creating an H.323 class map, in the Policy Object Manager, from the Add or Edit Class Maps dialog boxes for H.323, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring Class Maps for Inspection Policies, page 17-26](#).

When creating an H.323 policy map, in the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit H.323 Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring H.323 Maps, page 17-45](#).

**Field Reference****Table 17-27 H.323 Class and Policy Maps Add and Edit Match Condition and Action Dialog Boxes**

| Element                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Match Type<br>Class Name<br>(Policy Map only) | Enables you to use an existing H.323 class map or define a new H.323 class map. <ul style="list-style-type: none"> <li>Use Specified Values—You want to define the class map on this dialog box.</li> <li>Use Values in Class Map—You want to select an existing H.323 class map policy object. Enter the name of the H.323 class map in the <b>Class Name</b> field. Click <b>Select</b> to select the map from a list or to create a new class map object.</li> </ul> |
| Criterion                                     | Specifies which criterion of H.323 traffic to match: <ul style="list-style-type: none"> <li>Called Party—Matches the called party address.</li> <li>Calling Party—Matches the calling party address.</li> <li>Media Type—Matches the media type.</li> </ul>                                                                                                                                                                                                             |
| Type                                          | Specifies whether the map includes traffic that matches or does not match the criterion. For example, if Doesn't Match is selected on the string "example.com," then any traffic that contains "example.com" is excluded from the map. <ul style="list-style-type: none"> <li>Matches—Matches the criterion.</li> <li>Doesn't Match—Does not match the criterion.</li> </ul>                                                                                            |
| Action<br>(Policy Map only)                   | The action you want the device to take for traffic that matches the defined criteria.                                                                                                                                                                                                                                                                                                                                                                                   |

**Variable Fields**

The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see.

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Value      | The regular expression you want to evaluate. You can select one of the following: <ul style="list-style-type: none"> <li>Regular Expression—The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression object.</li> <li>Regular Expression Group—The regular expression group object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression group object.</li> </ul> |
| Media Type | The type of media you want to inspect, audio, video, or data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Configuring HTTP Maps for ASA 7.1.x, PIX 7.1.x, FWSM 3.x and IOS Devices

Use the Add and Edit HTTP Map dialog boxes to define HTTP maps for ASA 7.1.x, PIX 7.1.x, FWSM 3.x, and IOS devices.

The enhanced HTTP inspection feature, which is also known as an application firewall, verifies that HTTP messages conform to RFC 2616, use RFC-defined methods, and comply with various other criteria. This can help prevent attackers from using HTTP messages for circumventing network security policy.

When you enable HTTP inspection with an HTTP map, strict HTTP inspection with the action reset and log is enabled by default. You can change the actions performed in response to inspection failure, but you cannot disable strict inspection as long as the HTTP map remains enabled. Security Manager uses the **http-map** command to configure the map on the device.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > HTTP (ASA 7.1.x/PIX 7.1.x/FWSM3.x/IOS)** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

### Field Reference

**Table 17-28** Add and Edit HTTP Map Dialog Boxes for ASA 7.1.x/PIX 7.1.x/FWSM 3.x/IOS Devices

| Element                      | Description                                                                                                                                                                                                                    |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                         | The name of the policy object. A maximum of 40 characters is allowed.                                                                                                                                                          |
| Description                  | A description of the policy object. A maximum of 200 characters is allowed.                                                                                                                                                    |
| General tab                  | Defines the action taken when non-compliant HTTP requests are received and to enable verification of content type. For a description of the options, see <a href="#">HTTP Map General Tab, page 17-51</a> .                    |
| Entity Length tab            | Defines the action taken if the length of the HTTP content falls outside of configured targets. For a description of the options, see <a href="#">HTTP Map Entity Length Tab, page 17-52</a> .                                 |
| RFC Request Method tab       | Defines the action that the security appliance should take when specific RFC request methods are used in the HTTP request. For a description of the options, see <a href="#">HTTP Map RFC Request Method Tab, page 17-54</a> . |
| Extension Request Method tab | Defines the action taken when specific extension request methods are used in the HTTP request. For a description of the options, see <a href="#">HTTP Map Extension Request Method Tab, page 17-55</a> .                       |
| Port Misuse tab              | Defines the action taken when specific undesirable applications are encountered. For a description of the options, see <a href="#">HTTP Map Port Misuse Tab, page 17-56</a> .                                                  |
| Transfer Encoding tab        | Defines the action taken when specific transfer encoding types are used in the HTTP request. For a description of the options, see <a href="#">HTTP Map Transfer Encoding Tab, page 17-57</a> .                                |

**Table 17-28** Add and Edit HTTP Map Dialog Boxes for ASA 7.1.x/PIX 7.1.x/FWSM 3.x/IOS Devices

| Element                         | Description                                                                                                                                                                                                                                                             |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Category                        | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , page 6-12.                                                                                                               |
| Allow Value Override per Device | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , page 6-18 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , page 6-17. |
| Overrides                       |                                                                                                                                                                                                                                                                         |
| Edit button                     | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                            |

## HTTP Map General Tab

Use the General tab to define the action taken when non-compliant HTTP requests are received and to enable verification of content type.

### Navigation Path

Click the General tab on the Add and Edit HTTP Map dialog boxes for ASA 7.1.x/PIX 7.1.x/FWSM 3.x/IOS Devices. See [Configuring HTTP Maps for ASA 7.1.x, PIX 7.1.x, FWSM 3.x and IOS Devices](#), page 17-50.

| Action<br>Generate Syslog                                                   | To configure an action for a method, select it, then select an action and optionally select <b>Generate Syslog</b> if you want a message added to the syslog when an HTTP request containing the selected method is encountered. Click the >> button to add it to the Selected Methods list. (To remove a method from the selected list, select it and click the << button.)<br><br><b>Tip</b> You can select multiple methods at a time using Ctrl+click if the action and syslog requests are the same for each.<br><br>The actions you can specify are: <ul style="list-style-type: none"> <li>• Allow Packet—Allow the message.</li> <li>• Drop Packet—Close the connection.</li> <li>• Reset Connection (default)—Send a TCP reset message to client and server.</li> </ul> |
| Specify the action to be applied for the remaining available methods above. | Whether to define a default action for the methods for which you have not configured specific actions above. If you select this option, select the action and syslog setting to use for the default action.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**HTTP Map Port Misuse Tab**

Use the Port Misuse tab to enable port misuse application firewall inspection. The application categories you can configure are:

- IM—Instant Messaging. The applications checked for are Yahoo! Messenger, AIM, and MSN IM.
- P2P—Peer-to-peer applications. The Kazaa application is checked.
- Tunneling—Tunneling applications. The applications checked for are HTTPPort/HTTHost, GNU Httptunnel, GotoMyPC, Firethru, and Http-tunnel.com Client.

**Navigation Path**

Click the Port Misuse tab on the Add and Edit HTTP Map dialog boxes for ASA 7.1.x/PIX 7.1.x/FWSM 3.x/IOS Devices. See [Configuring HTTP Maps for ASA 7.1.x, PIX 7.1.x, FWSM 3.x and IOS Devices, page 17-50](#).

| Generate Syslog                                                                | <p><b>Tip</b> You can select multiple categories at a time using Ctrl+click if the action and syslog requests are the same for each.</p> <p>The actions you can specify are:</p> <ul style="list-style-type: none"> <li>• Allow Packet—Allow the message.</li> <li>• Drop Packet—Close the connection.</li> <li>• Reset Connection (default)—Send a TCP reset message to client and server.</li> </ul> |
| Specify the action to be applied for the remaining available categories above. | Whether to define a default action for the categories for which you have not configured specific actions above. If you select this option, select the action and syslog setting to use for the default action.                                                                                                                                                                                         |

**HTTP Map Transfer Encoding Tab**

Use the Transfer Encoding tab to enable inspection based on the transfer encoding type. The encoding types that you can configure are:

- **Chunked**—Identifies the transfer encoding type in which the message body is transferred as a series of chunks.
- **Compressed**—Identifies the transfer encoding type in which the message body is transferred using UNIX file compression.
- **Deflate**—Identifies the transfer encoding type in which the message body is transferred using zlib format (RFC 1950) and deflate compression (RFC 1951).
- **GZIP**—Identifies the transfer encoding type in which the message body is transferred using GNU zip (RFC 1952).
- **Identity**—Identifies connections in which no transfer encoding is performed in the message body.

**Navigation Path**

Click the Transfer Encoding tab on the Add and Edit HTTP Map dialog boxes for ASA 7.1.x/PIX 7.1.x/FWSM 3.x/IOS Devices. See [Configuring HTTP Maps for ASA 7.1.x, PIX 7.1.x, FWSM 3.x and IOS Devices](#), page 17-50.

## Configuring HTTP Maps for ASA 7.2+ and PIX 7.2+ Devices

Use the Add and Edit HTTP Map dialog boxes to define the match criterion and values for the HTTP inspect map for ASA and PIX software releases 7.2 and higher.

**Navigation Path**

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > HTTP (ASA 7.2+/PIX 7.2+)** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row, then select **Edit Object**.

**Field Reference****Table 17-35 Add and Edit HTTP Map Dialog Boxes (ASA 7.2+/PIX 7.2+)**

| Element | Description                                                           |
|---------|-----------------------------------------------------------------------|
| Name    | The name of the policy object. A maximum of 40 characters is allowed. |

**Table 17-35 Add and Edit HTTP Map Dialog Boxes (ASA 7.2+/PIX 7.2+) (Continued)**

| Element                       | Description                                                                                                                                                                       |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description                   | A description of the policy object. A maximum of 200 characters is allowed.                                                                                                       |
| <b>Parameters tab</b>         |                                                                                                                                                                                   |
| Body Match Maximum            | The maximum number of characters in the body of an HTTP message that should be searched in a body match.<br><b>Tip</b> A high value can have a significant impact on performance. |
| Check for protocol violations | Whether to check for protocol violations.                                                                                                                                         |
| Action                        | The action to take based on the defined settings. You can drop, reset, or log the connection.                                                                                     |
| Spoof Server                  | Enables you to replace the server HTTP header value with the specified string.                                                                                                    |

**Match Condition and Action Tab**

The Match All table lists the criteria included in the policy map. Each row indicates whether the inspection is looking for traffic that matches or does not match each criterion, the criterion and value that is inspected, and the action to be taken for traffic that satisfies the conditions.

- To add a criterion, click the Add button and fill in the Match Condition and Action dialog box (see [HTTP Class and Policy Map \(ASA 7.2+/PIX 7.2+\) Add or Edit Match Condition \(and Action\) Dialog Boxes, page 17-59](#)).
- To edit a criterion, select it and click the Edit button.
- To delete a criterion, select it and click the Delete button.

|                                 |                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Category                        | The category assigned to the object. Categories help you organize and identify rules and objects. | Overrides                       |                                                                                                                                                                                                                                                                                                                                 |
| Edit button                     | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                                                                                    |
| Overrides: None                 | Shows that no overrides exist on the device. You must manually set overrides in order to change the display. For more information, see <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-17</a> .<br><b>Note</b> Selecting Allow Value Override per Device does not automatically set overrides. |

## HTTP Class and Policy Map (ASA 7.2+/PIX 7.2+) Add or Edit Match Condition (and Action) Dialog Boxes

Use the Add or Edit HTTP Match Criterion (for HTTP class maps) or Match Condition and Action (for HTTP policy maps) dialog boxes to do the following:

- Define the match criterion and value for an HTTP class map.

- Select an HTTP class map when creating an HTTP policy map.
- Define the match criterion, value, and action directly in an HTTP policy map.

These types of maps are used only for devices running ASA 7.2 or higher, or PIX 7.2 or higher, operating systems.

The fields on this dialog box change based on the criterion you select and whether you are creating a class map or policy map. You can use the following criteria:

- Request/Response Content Type Mismatch—Specifies that the content type in the response must match one of the MIME types in the accept field of the request.
- Request Arguments—Applies the regular expression match to the arguments of the request.
- Request Body—Applies the regular expression match to the body of the request.
- Request Body Length—Specifies that the body length of the request be matched as greater than or less than the specified number of bytes.
- Request Header Count—Specifies that the number of headers in the request be matched as greater than or less than the specified number.
- Request Header Length—Specifies that the header length of the request be matched as greater than or less than the specified number of bytes.
- Request Header Field—Applies the regular expression match to the header of the request.
- Request Header Field Count—Applies the regular expression match to the header of the request based on a specified number of header fields.
- Request Header Field Length—Applies the regular expression match to the header of the request based on a specified field length.
- Request Header Content Type—Specifies the content type to evaluate in the content-type header field of the request.
- Request Header Transfer Encoding—Specifies the transfer encoding to evaluate in the transfer-encoding header field of the request.
- Request Header Non-ASCII—Specifies whether there are non-ASCII characters in the header of the request.
- Request Method—Specifies the method of the request to match.
- Request URI—Applies the regular expression match to the URI of the request.
- Request URI Length—Specifies that the URI length of the request be matched as greater than or less than the specified number of bytes.
- Response Body ActiveX—Specifies whether there is ActiveX content in the body of the request.
- Response Body Java Applet—Specifies whether there is a Java applet in the body of the request.
- Response Body—Applies the regular expression match to the body of the response.
- Response Body Length—Specifies that the body length of the response be matched as greater than or less than the specified number of bytes.
- Response Header Count—Specifies that the number of headers in the response be matched as greater than or less than the specified number.
- Response Header Length—Specifies that the header length of the response be matched as greater than or less than the specified number of bytes.
- Response Header Field—Applies the regular expression match to the header of the response.

- Response Header Field Count—Applies the regular expression match to the header of the response based on a specified number of header fields.
- Response Header Field Length—Applies the regular expression match to the header of the response based on a specified field length.
- Response Header Content Type—Specifies the content type to evaluate in the content-type header field of the response.
- Response Header Transfer Encoding—Specifies the transfer encoding to evaluate in the transfer-encoding header field of the response.
- Response Header Non-ASCII—Specifies whether there are non-ASCII characters in the header of the response.
- Response Status Line—Applies the regular expression match to the status line of the response.

### Navigation Path

When creating an HTTP class map, in the Policy Object Manager, from the Add or Edit Class Maps dialog boxes for HTTP, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring Class Maps for Inspection Policies, page 17-26](#).

When creating an HTTP policy map, in the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit HTTP Map dialog boxes for ASA/PIX 7.2+ devices, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring HTTP Maps for ASA 7.2+ and PIX 7.2+ Devices, page 17-58](#).

**Table 17-36 HTTP Class and Policy Maps (ASA 7.2+/PIX 7.2+) Add and Edit Match Condition and Action Dialog Boxes**

| Element                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Match Type<br>Class Name<br>(Policy Map only) | Enables you to use an existing HTTP class map or define a new HTTP class map. <ul style="list-style-type: none"> <li>• Use Specified Values—You want to define the class map on this dialog box.</li> <li>• Use Values in Class Map—You want to select an existing HTTP class map policy object. Enter the name of the HTTP class map in the <b>Class Name</b> field. Click <b>Select</b> to select the map from a list or to create a new class map object.</li> </ul> |
| Criterion                                     | Specifies which criterion of HTTP traffic to match. The criteria are described above.                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 17-36 HTTP Class and Policy Maps (ASA 7.2+/PIX 7.2+) Add and Edit Match Condition and Action Dialog Boxes (Continued)**

| Element                                                                                                                                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type                                                                                                                                                                  | <p>Specifies whether the map includes traffic that matches or does not match the criterion. For example, if Doesn't Match is selected on the string "example.com," then any traffic that contains "example.com" is excluded from the map.</p> <ul style="list-style-type: none"> <li>Matches—Matches the criterion. For some criteria, this is the only available option.</li> <li>Doesn't Match—Does not match the criterion.</li> </ul>                                           |
| Action<br>(Policy Map only)                                                                                                                                           | The action you want the device to take for traffic that matches the defined criteria. The types of action depend on the criterion you select.                                                                                                                                                                                                                                                                                                                                       |
| <p><b>Variable Fields</b></p> <p>The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Field Name                                                                                                                                                            | <p>The name of the header field to evaluate. You can select one of the following:</p> <ul style="list-style-type: none"> <li>Predefined—The predefined HTTP header fields.</li> <li>Regular Expression—The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression object.</li> </ul> |

**Table 17-36 HTTP Class and Policy Maps (ASA 7.2+/PIX 7.2+) Add and Edit Match Condition and Action Dialog Boxes (Continued)**

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Value               | <p>The regular expression you want to evaluate. You can select one of the following:</p> <ul style="list-style-type: none"> <li>• Regular Expression—The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression object.</li> <li>• Regular Expression Group—The regular expression group object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression group object.</li> </ul> <p>When you are evaluating the Request Header Transfer Encoding or Response Header Transfer Encoding criteria, you can also select these options:</p> <ul style="list-style-type: none"> <li>• Specified By—One of the following predefined types of transfer encoding: <ul style="list-style-type: none"> <li>– Chunked—The message body is transferred as a series of chunks.</li> <li>– Compressed—The message body is transferred using UNIX file compression.</li> <li>– Deflate—The message body is transferred using zlib format (RFC 1950) and deflate compression (RFC 1951).</li> <li>– GZIP—The message body is transferred using GNU zip (RFC 1952).</li> <li>– Identity—No transfer encoding is performed.</li> </ul> </li> <li>• Empty—The transfer-encoding field in request header is empty.</li> </ul> |
| Greater Than Length | <p>The length in bytes of the evaluated field. The criterion matches if the length is greater than the specified number, and does not match if the field is less than the specified number.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Greater Than Count  | <p>The number of evaluated items. ## Configuring IM Maps for ASA 7.2+, PIX 7.2+ Devices

Use the Add and Edit IM Map dialog boxes to define settings for define an Instant Messenger (IM) inspect map for devices running ASA/PIX 7.2 or higher. An IM map lets you change the default configuration values used for IM application inspection.

Instant Messaging causes concern due to its use of clear text when conducting business and the potential for network attacks and the spreading of viruses. Thus, you might want to block certain types of instant messages from occurring, while allowing others.

For ASA and PIX devices, IM application inspection provides detailed access control to control network usage. You can use regular expressions to help stop leakage of confidential data and the propagation of network threats. You can inspect Yahoo! Messenger or MSN Messenger traffic.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > IM (ASA 7.2+/PIX 7.2+)** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

**Field Reference****Table 17-37 Add and Edit IM Map Dialog Boxes**

| Element     | Description                                                                 |
|-------------|-----------------------------------------------------------------------------|
| Name        | The name of the policy object. A maximum of 40 characters is allowed.       |
| Description | A description of the policy object. A maximum of 200 characters is allowed. |

**Match Condition and Action Tab**

The Match All table lists the criteria included in the policy map. Each row indicates whether the inspection is looking for traffic that matches or does not match each criterion, the criterion and value that is inspected, and the action to be taken for traffic that satisfies the conditions.

- To add a criterion, click the Add button and fill in the Match Condition and Action dialog box (see [IM Class and Policy Map \(ASA 7.2+/PIX 7.2+\) Add or Edit Match Condition \(and Action\) Dialog Boxes, page 17-65](#)).
- To edit a criterion, select it and click the Edit button.
- To delete a criterion, select it and click the Delete button.

|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Category                        | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-12</a> .                                                                                                              |
| Allow Value Override per Device | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-17</a> . |
| Overrides                       |                                                                                                                                                                                                                                                                        |
| Edit button                     | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                           |

**IM Class and Policy Map (ASA 7.2+/PIX 7.2+) Add or Edit Match Condition (and Action) Dialog Boxes**

Use the Add or Edit IM Match Criterion (for IM class maps) or Match Condition and Action (for IM policy maps) dialog boxes to do the following:

- Define the match criterion and value for an IM class map.
- Select an IM class map when creating an IM policy map.
- Define the match criterion, value, and action directly in an IM policy map.

These types of maps are used only for devices running ASA 7.2 or higher, or PIX 7.2 or higher, operating systems.

The fields on this dialog box change based on the criterion you select and whether you are creating a class map or policy map.

**Navigation Path**

When creating an IM class map, in the Policy Object Manager, from the Add or Edit Class Maps dialog boxes for IM, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring Class Maps for Inspection Policies, page 17-26](#).

When creating an IM policy map, in the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit IM Map dialog boxes for ASA 7.2/PIX 7.2, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring IM Maps for ASA 7.2+, PIX 7.2+ Devices, page 17-64](#).

## Configuring IM Maps for IOS Devices

Use the Add and Edit IM Map (IOS) dialog boxes to configure Instant Messaging (IM) inspection policy map objects for IOS devices. An IM map lets you change the default configuration values used for IM application inspection.

Instant Messaging causes concern due to its use of clear text when conducting business and the potential for network attacks and the spreading of viruses. Thus, you might want to block certain types of instant messages from occurring, while allowing others.

IM application inspection provides detailed access control to control network usage. It also helps stop leakage of confidential data and the propagation of network threats. The scope can be limited by identifying permitted or denied servers. Inspection of Yahoo! Messenger, MSN Messenger, and AOL instant messages are supported.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > IM (IOS)** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row, then select **Edit Object**.

| Allow Value Override per Device Overrides Edit button                                                                                                                                                                                                                    | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-17</a> .<br><br>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object. |

## Configuring IP Options Maps

Use the Add and Edit IP Options Map dialog boxes to define maps for the inspection of the options in an IP packet header on ASA 8.2(2)+ devices. The options field provides for control functions that are required in some situations but unnecessary for most common communications.

If you do not configure IP options inspection, the ASA device drops packets that have any options configured, with one exception. In routed mode, packets that contain the router alert option are allowed. (To disallow router alert packets, create an IP options map with router alert deselected, and configure an inspection rule to inspect IP Options using the policy map.)

**Tip**

Because the no operation (NOP) option might be used as padding to ensure proper packet-header size and alignment, you might want to allow NOP.

For each option, you can select whether to:

- **Allow**—Allow the packet and do not change the IP header options field.
- **Clear**—Allow the packet and clear the option from the IP header options field.

If you do not select an option, the option is prohibited, and packets containing the option are dropped. Any option not listed here also results in a dropped packet; you cannot change this behavior.

**Navigation Path**

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > IP Options** from the Object Type selector. Right-click inside the work area, then select **New Object**, or right-click a row and select **Edit Object**.

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                | The name of the policy object. A maximum of 128 characters is allowed.                                                                                                                                                                                                                                                                                                                |
| Description         | A description of the policy object.                                                                                                                                                                                                                                                                                                                                                   |
| End of Options List | End of Options List (EOOL), or IP Option 0, contains just a single zero byte and appears at the end of all options to mark the end of a list of options. This might not coincide with the end of the header according to the header length.                                                                                                                                           |
| No operation        | No Operation (NOP), or IP Option 1, is used for padding. The Options field in the IP header can contain zero, one, or more options, which makes the total length of the field variable. However, the IP header must be a multiple of 32 bits. If the number of bits of all options is not a multiple of 32 bits, the NOP option is used as to align the options on a 32-bit boundary. |
| Router alert        | Router Alert (RTRALT), or IP Option 20, notifies transit routers to inspect the contents of the packet even when the packet is not destined for that router. This inspection is valuable when implementing RSVP and similar protocols require relatively complex processing from the routers along the packet's delivery path.                                                        |

**Table 17-40 Add and Edit IP Options Map Dialog Boxes (Continued)**

| Element                                   | Description                                                                                                                                                                                                                                                            |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Category                                  | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-12</a> .                                                                                                              |
| Allow Value Override per Device Overrides | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-17</a> . |
| Edit button                               | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                           |

## Configuring IPv6 Maps

Use the Add and Edit IPv6 Map dialog boxes to define the match criteria and values for an IPv6 inspect map. You can use an IPv6 map to selectively drop IPv6 packets based on following types of extension headers found anywhere in the IPv6 packet:

- Hop-by-Hop Options
- Routing (Type 0)
- Fragment
- Destination Options
- Authentication
- Encapsulating Security Payload

Service objects corresponding to these protocols are available in the Services table in the [Policy Object Manager, page 6-4](#).

### Note

With the release of Security Manager 4.4 and versions 9.0 and higher of the ASA, the separate policies for configuring IPv4 and IPv6 inspection rules were unified. However, IPv6 maps are still provided in support of earlier versions.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > IPv6** from the Object Type selector. Right-click inside the table, then select **New Object** or right-click a row, then select **Edit Object**.

| Permit only known Extension Headers                                                                                                                                                                                                                                                                                                                                                                                                                                      | Whether the ASA should verify the IPv6 extension header. When selected and an unknown IPv6 extension header is encountered, the ASA drops the packet and logs the action.<br><br>This option is selected by default.                                                           |
| Enforce Extension Header Order                                                                                                                                                                                                                                                                                                                                                                                                                                           | Whether the ASA should enforce extension header order as defined in the RFC 2460 specification. When selected and an error is detected, the ASA drops the packet and logs the action.<br><br>This option is selected by default.                                               |
| <b>Match Condition and Action Tab</b>                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                |
| <p>The Match All table lists the criteria included in the policy map. Each row indicates whether the inspection is looking for traffic that matches or does not match each criterion, the criterion and value that is inspected, and the action to be taken for traffic that satisfies the conditions.</p> <p>These criteria entries are created and edited in the <a href="#">IPv6 Policy Maps Add or Edit Match Condition and Action Dialog Boxes, page 17-71</a>.</p> |                                                                                                                                                                                                                                                                                |
| Category                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-12</a> .                                                                                                                      |
| Allow Value Override per Device                                                                                                                                                                                                                                                                                                                                                                                                                                          | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-17</a> .         |
| Overrides                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                |
| Edit button                                                                                                                                                                                                                                                                                                                                                                                                                                                              | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides in the <a href="#">Policy Object Overrides Window, page 6-20</a> . The <b>Overrides</b> field indicates the number of devices that have overrides for this object. |

**IPv6 Policy Maps Add or Edit Match Condition and Action Dialog Boxes**

Use the Add or Edit Match Condition and Action dialog boxes to define an Extension Header match criterion and action for an IPv6 policy map. The contents of the Extension Headers are not processed; an action is applied based solely on the presence of a specified EH type.

The fields in these dialog boxes change based on the criterion you select.

**Note**

You can apply multiple match definitions to one IPv6 policy map.

**Navigation Path**

In the Policy Object Manager, from the Match Condition and Action tab on the Add or Edit IPv6 Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring IPv6 Maps, page 17-70](#).

## Configuring IPsec Pass Through Maps

Use the Add and Edit IPsec Pass Through Map dialog boxes to configure settings for the IPsec Pass Through Map policy object. An IPsec Pass Through policy map lets you change the default configuration values used for IPsec Pass Through inspection.

The IPsec Pass Through inspection engine lets the security appliance pass ESP (IP protocol 50) and AH (IP protocol 51) traffic that is formed between two hosts because of successful IKE (UDP port 500) negotiation without the requirement of specific ESP or AH access lists.

The ESP or AH traffic is permitted by the inspection engine with the configured idle timeout if there is an existing control flow and it is within the connection limit defined in the MPF framework. A new control flow is created for IKE UDP port 500 traffic with the configured UDP idle timeout if there is not one, or it uses the existing flow.

To ensure that the packet arrives into the inspection engine, a hole is punched for all such traffic (ESP and AH). This inspect is attached to the control flow. The control flow is present as long as there is at least one data flow (ESP or AH) established, but the traffic always flows on the same connection. Because this IKE connection is kept open as long as data flows, a rekey would always succeed. The flows are created irrespective of whether NAT is being used. However, PAT is not supported.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > IPsec Pass Through** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

## Configuring NetBIOS Maps

Use the Add or Edit NetBIOS Map dialog boxes to define maps for NetBIOS inspection. A NetBIOS policy map lets you change the default configuration values used for NetBIOS inspection.

The NetBIOS inspection engine translates IP addresses in the NetBIOS name service (NBNS) packets according to the security appliance NAT configuration.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > NetBIOS** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

## Configuring ScanSafe Maps

Use the Add or Edit ScanSafe Map dialog boxes to define maps for ScanSafe inspection. A ScanSafe policy map lets you change the default configuration values used for ScanSafe inspection.

The fields on this dialog box change, depending upon whether you are creating a class map or a policy map.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > ScanSafe** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

## Configuring SIP Maps

Use the Add and Edit SIP Map dialog boxes to configure values used for SIP application inspection. A SIP inspection map lets you change the default configuration values used for SIP application inspection.

SIP is a widely used protocol for Internet conferencing, telephony, presence, events notification, and instant messaging. Partially because of its text-based nature and partially because of its flexibility, SIP networks are subject to a large number of security threats.

SIP application inspection provides address translation in message header and body, dynamic opening of ports and basic sanity checks. It also supports application security and protocol conformance, which enforce the sanity of the SIP messages, as well as detect SIP-based attacks.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > SIP (ASA/PIX/FWSM)** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

| Element                                                                                                       | Description                                                                                                                                                                                                      |
|---------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                                                                                                          | The name of the policy object. A maximum of 40 characters is allowed.                                                                                                                                            |
| Description                                                                                                   | A description of the policy object. A maximum of 200 characters is allowed.                                                                                                                                      |
| <b>Parameters tab</b>                                                                                         |                                                                                                                                                                                                                  |
| Enable SIP Instant Messaging Extensions                                                                       | Whether to enable Instant Messaging extensions.                                                                                                                                                                  |
| Permit Non-SIP Traffic on SIP Port                                                                            | Whether to permit non-SIP traffic on the SIP port.                                                                                                                                                               |
| Hide Server's and Endpoint's IP Address                                                                       | Whether to hide the IP addresses, which enables IP address privacy.                                                                                                                                              |
| Check RTP Packets for Protocol Conformance<br>Limit Payload to Audio or Video based on the Signaling Exchange | Whether to check RTP/RTCP packets flowing on the pinholes for protocol conformance. If you select this option, you can also elect to enforce the payload type to be audio/video based on the signaling exchange. |
| If Number of Hops to Destination is Greater Than 0                                                            | Whether to check if the value of Max-Forwards header is zero. When it is greater than zero, the action you select in the Action field is implemented. The default is to drop the packet.                         |
| If State Transition is Detected                                                                               | Whether to check SIP state transitions. When a transition is detected, the action you select in the Action field is implemented. The default is to drop the packet.                                              |
| If Header Fields Fail Strict Validation                                                                       | Whether to take the action specified in the Action field if the SIP header fields are invalid. The default is to drop the packet.                                                                                |
| Inspect Server's and Endpoint's Software Version                                                              | Whether to inspect the SIP endpoint software version in User-Agent and Server headers. The default is to mask the information.                                                                                   |
| If Non-SIP URI is Detected                                                                                    | Whether to take the action specified in the Action field if a non-SIP URI is detected in the Alert-Info and Call-Info headers. The default is to mask the information.                                           |

**Match Condition and Action Tab**

The Match All table lists the criteria included in the policy map. Each row indicates whether the inspection is looking for traffic that matches or does not match each criterion, the criterion and value that is inspected, and the action to be taken for traffic that satisfies the conditions.

- To add a criterion, click the Add button and fill in the Match Condition and Action dialog box (see [SIP Class and Policy Maps Add or Edit Match Condition \(and Action\) Dialog Boxes, page 17-79](#)).
- To edit a criterion, select it and click the Edit button.
- To delete a criterion, select it and click the Delete button.

|          |                                                                                                                                                           |

| Element                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Allow Value Override per Device Overrides Edit button | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-17</a> .<br><br>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object. |

## SIP Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes

Use the Add or Edit SIP Match Criterion (for SIP class maps) or Match Condition and Action (for SIP policy maps) dialog boxes to do the following:

- Define the match criterion and value for a SIP class map.
- Select a SIP class map when creating a SIP policy map.
- Define the match criterion, value, and action directly in a SIP policy map.

The fields on this dialog box change based on the criterion you select and whether you are creating a class map or policy map.

### Navigation Path

When creating a SIP class map, in the Policy Object Manager, from the Add or Edit Class Maps dialog boxes for SIP, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring Class Maps for Inspection Policies, page 17-26](#).

When creating a SIP policy map, in the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit SIP Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring SIP Maps, page 17-77](#).

| Content Type    | <p>The content type to evaluate as specified in the content-type header field. You can select one of the following:</p> <ul style="list-style-type: none"> <li>• SDP—Matches an SDP SIP content header type.</li> <li>• Regular Expression, Regular Expression Group—The regular expression or regular expression group to evaluate. See the explanation for the Value field for an explanation of these options.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Resource Method | <p>The request method you want to inspect:</p> <ul style="list-style-type: none"> <li>• ack—Confirms that the client has received a final response to an INVITE request.</li> <li>• bye—Terminates a call and can be sent by either the caller or the called party.</li> <li>• cancel—Cancels any pending searches but does not terminate a call that has already been accepted.</li> <li>• info—Communicates mid-session signaling information along the signaling path for the call.</li> <li>• invite—Indicates a user or service is being invited to participate in a call session.</li> <li>• message—Sends instant messages where each message is independent of any other message.</li> <li>• notify—Notifies a SIP node that an event which has been requested by an earlier SUBSCRIBE method has occurred.</li> <li>• options—Queries the capabilities of servers.</li> <li>• prack—Provisional response acknowledgment.</li> <li>• refer—Requests that the recipient REFER to a resource provided in the request.</li> <li>• register—Registers the address listed in the To header field with a SIP server.</li> <li>• subscribe—Requests notification of an event or set of events at a later time.</li> <li>• unknown—Uses a nonstandard extension that could have unknown security impacts on the network.</li> <li>• update—Permits a client to update parameters of a session but has no impact on the state of a dialog.</li> </ul> |

## Configuring Skinny Maps

Use the Add or Edit Skinny Map dialog boxes to define Skinny maps for Skinny inspection. A Skinny policy map lets you change the default configuration values used for Skinny inspection.

Skinnny (SCCP) is a simplified protocol used in VoIP networks. Cisco IP Phones using SCCP can coexist in an H.323 environment. When used with Cisco CallManager, the SCCP client can interoperate with H.323 compliant terminals. Application layer functions in the security appliance recognize SCCP version 3.3. There are 5 versions of the SCCP protocol: 2.4, 3.0.4, 3.1.1, 3.2, and 3.3.2.

The security appliance supports all versions through 3.3.2. The security appliance supports PAT and NAT for SCCP. PAT is necessary if you have more IP phones than global IP addresses for the IP phones to use. By supporting NAT and PAT of SCCP Signaling packets, Skinny application inspection ensures that all SCCP signaling and media packets can traverse the security appliance.

Normal traffic between Cisco CallManager and Cisco IP Phones uses SCCP and is handled by SCCP inspection without any special configuration. The security appliance also supports DHCP options 150 and 66, which it accomplishes by sending the location of a TFTP server to Cisco IP Phones and other DHCP clients. Cisco IP Phones might also include DHCP option 3 in their requests, which sets the default route.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > Skinny** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row, then select **Edit Object**.

| <b>Match Condition and Action Tab</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                                                                                                                                        |
| <p>The Match All table lists the criteria included in the policy map. Each row indicates whether the inspection is looking for traffic that matches or does not match each criterion, the criterion and value that is inspected, and the action to be taken for traffic that satisfies the conditions.</p> <ul style="list-style-type: none"> <li>To add a criterion, click the Add button and fill in the Match Condition and Action dialog box (see <a href="#">Skinny Policy Maps Add or Edit Match Condition and Action Dialog Boxes, page 17-83</a>).</li> <li>To edit a criterion, select it and click the Edit button.</li> <li>To delete a criterion, select it and click the Delete button.</li> </ul> |                                                                                                                                                                                                                                                                        |
| Category                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-12</a> .                                                                                                              |
| Allow Value Override per Device                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-17</a> . |
| Overrides                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                        |
| Edit button                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                           |

## Skinny Policy Maps Add or Edit Match Condition and Action Dialog Boxes

Use the Add or Edit Match Condition and Action dialog boxes to define the match criterion, value, and action for a Skinny policy map.

### Navigation Path

In the Policy Object Manager, from the Match Condition and Action tab on the Add or Edit Skinny Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See [Configuring SIP Maps, page 17-77](#).

| Element   | Description                                                                                                                                                                                                                                                                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criterion | Specifies which criterion of Skinny traffic to match.                                                                                                                                                                                                                                                                                                                |
| Type      | <p>Specifies whether the map includes traffic that matches or does not match the criterion. For example, if Doesn't Match is selected on 0xFFFF, then any traffic that has the message ID 0xFFFF is excluded from the map.</p> <ul style="list-style-type: none"> <li>Matches—Matches the criterion.</li> <li>Doesn't Match—Does not match the criterion.</li> </ul> |

**Table 17-49** Skinny Policy Maps Add and Edit Match Condition and Action Dialog Boxes

| Element | Description                                                                                                                                                                                |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ID Type | The hexadecimal value for the message ID to inspect: <ul style="list-style-type: none"> <li>Value—Matches a single hexadecimal value.</li> <li>Range—Matches a range of values.</li> </ul> |
| Action  | The action you want the device to take for traffic that matches the defined criteria.                                                                                                      |

## Configuring SNMP Maps

Use the Add and Edit SNMP Map dialog boxes to define maps for SNMP inspection. An SNMP policy map lets you change the default configuration values used for SNMP application inspection.

SNMP application inspection lets you restrict SNMP traffic to a specific version of SNMP. Earlier versions of SNMP are less secure; therefore, denying certain SNMP versions may be required by your security policy. The security appliance can deny SNMP versions 1, 2, 2c, or 3. You control the versions permitted by creating an SNMP map. You then apply the SNMP map when you enable SNMP inspection.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > SNMP** from the Object Type selector. Right-click inside the work area, then select **New Object**, or right-click a row and select **Edit Object**.

## Configuring Regular Expression Groups

Use the Add and Edit Regular Expression Groups dialog boxes to define regular expression groups, which contain multiple regular expressions. Groups make it possible for you to create modular regular expressions and group them in multiple ways for various uses. The objects can be used in some inspection class maps and inspection policy maps.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Regular Expressions Groups** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

|                                 | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                           |

## Configuring Regular Expressions for Inspection Maps

Use the Add and Edit Regular Expression dialog boxes to define regular expressions for use in class and policy inspection maps or in regular expression group policy objects.

A regular expression matches text strings either literally as an exact string or by using metacharacters so you can match multiple variants of a text string. You can use regular expressions in various type of class and policy inspection maps to match various target items, for example, the content of certain application traffic such as the body text inside an HTTP packet.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Regular Expressions** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Allow Value Override per Device | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , page 6-18 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , page 6-17. |
| Overrides                       |                                                                                                                                                                                                                                                                         |
| Edit button                     | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                            |

## Metacharacters Used to Build Regular Expressions

The following table explains the metacharacters you can use to build regular expressions in the Add and Edit Regular Expression dialog boxes (see [Configuring Regular Expressions for Inspection Maps](#), page 17-86).

Keep the following tips in mind when creating regular expressions:

- If you enter any metacharacters in your text string that you want to be used literally, add the backslash (\) escape character before them. For example, “example\l.com”.
- If you want to match upper and lower case characters, enter text in both upper- and lowercase. For example, “cats” is entered as “[cC][aA][tT][sS]”.

**Table 17-53 Metacharacters Used to Build Regular Expressions**

| Character | Description       | Notes                                                                                                                                                                                                                                                                                                                                                            |
|-----------|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| .         | Dot               | Matches any single character. For example, d.g matches dog, dag, dtg, and any word that contains those characters, such as doggonnit.                                                                                                                                                                                                                            |
| (exp)     | Subexpression     | A subexpression segregates characters from surrounding characters, so that you can use other metacharacters on the subexpression. For example, d(ola)g matches dog and dag, but dolag matches do and ag. A subexpression can also be used with repeat quantifiers to differentiate the characters meant for repetition. For example, ab(xy){3}z matches abxyxyz. |
|           | Alternation       | Matches either expression it separates. For example, dog cat matches dog or cat.                                                                                                                                                                                                                                                                                 |
| ?         | Question mark     | A quantifier that indicates that there are 0 or 1 of the previous expression. For example, lo?se matches lse or lose.                                                                                                                                                                                                                                            |
| *         | Asterisk          | A quantifier that indicates that there are 0, 1 or any number of the previous expression. For example, lo*se matches lse, lose, loose, etc.                                                                                                                                                                                                                      |
| +         | Plus              | A quantifier that indicates that there is at least 1 of the previous expression. For example, lo+se matches lose and loose, but not lse.                                                                                                                                                                                                                         |
| {x}       | Repeat Quantifier | Repeat exactly x times. For example, ab(xy){3}z matches abxyxyz.                                                                                                                                                                                                                                                                                                 |

Table 17-53 Metacharacters Used to Build Regular Expressions (Continued)

| Character | Description                | Notes                                                                                                                                                                                                                                                                                                                  |
|-----------|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|           | Minimum repeat quantifier  | Repeat at least x times. For example, ab(xy){2,}z matches abxyxyz, abxyxyxyz, etc.                                                                                                                                                                                                                                     |
| [abc]     | Character class            | Matches any character in the brackets. For example, [abc] matches a, b, or c.                                                                                                                                                                                                                                          |
| [^abc]    | Negated character class    | Matches a single character that is not contained within the brackets. For example, [^abc] matches any character other than a, b, or c. [^A-Z] matches any single character that is not an uppercase letter.                                                                                                            |
| [a-c]     | Character range class      | Matches any character in the range. [a-z] matches any lowercase letter. You can mix characters and ranges: [abcq-z] matches a, b, c, q, r, s, t, u, v, w, x, y, z, and so does [a-cq-z].<br><br>The dash (-) character is literal only if it is the last or the first character within the brackets: [abc-] or [-abc]. |
| “”        | Quotation marks            | Preserves trailing or leading spaces in the string. For example, “ test” preserves the leading space when it looks for a match.                                                                                                                                                                                        |
| ^         | Caret                      | Specifies the beginning of a line.                                                                                                                                                                                                                                                                                     |
| \         | Escape character           | When used with a metacharacter, matches a literal character. For example, \[ matches the left square bracket.                                                                                                                                                                                                          |
| char      | Character                  | When character is not a metacharacter, matches the literal character.                                                                                                                                                                                                                                                  |
| \r        | Carriage return            | Matches a carriage return 0x0d.                                                                                                                                                                                                                                                                                        |
| \n        | Newline                    | Matches a new line 0x0a.                                                                                                                                                                                                                                                                                               |
| \t        | Tab                        | Matches a tab 0x09.                                                                                                                                                                                                                                                                                                    |
| \f        | Formfeed                   | Matches a form feed 0x0c.                                                                                                                                                                                                                                                                                              |
| \xNN      | Escaped hexadecimal number | Matches an ASCII character using hexadecimal (exactly two digits).                                                                                                                                                                                                                                                     |
| \NNN      | Escaped octal number       | Matches an ASCII character as octal (exactly three digits). For example, the character 040 represents a space.                                                                                                                                                                                                         |

## Configuring Settings for Inspection Rules for IOS Devices

If you configure inspection rules, you can also configure inspection settings to change the default settings for some global inspection parameters for IOS devices. Most of the inspection settings relate to preventing or mitigating Denial of Service (DoS) attacks. The default settings for most of these options are appropriate for most networks, so configure this policy only if you need to adjust one or more settings. If you do not change a setting, it is not configured on the device (the default remains configured).

To open the Inspection settings page, do one of the following:

- (Device view) Select a device, then select **Firewall > Settings > Inspection** from the Policy selector.

- (Policy view) Select **Firewall > Settings > Inspection** from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click a device and select **Edit Firewall Settings > Inspection**.

The following table explains the available inspection settings.

**Table 17-54** *Inspection Page*

| Element                                                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Global Timeout Values</b>                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| TCP Establish Timeout (seconds)                                                           | How long to wait for a TCP session to reach the established state before dropping the session, in seconds, from 1-2147483. The default is 30.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| FIN Wait Time (seconds)                                                                   | How long to maintain TCP session state information after the firewall detects a FIN-exchange, in seconds, from 1-2147483. The FIN-exchange occurs when the TCP session is ready to close. The default is 5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| TCP Idle Time (seconds)                                                                   | How long to maintain a TCP session while there is no activity in the session, in seconds, from 1-2147483. The default is 3600 (one hour).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| UDP Idle Time (seconds)                                                                   | How long to maintain a UDP session while there is no activity in the session, in seconds, from 1-2147483. The default is 30.<br><br>When the software detects a valid UDP packet, the software establishes state information for a new UDP session. Because UDP is a connectionless service, there are no actual sessions, so the software approximates sessions by examining the information in the packet and determining if the packet is similar to other UDP packets (for example, it has similar source or destination addresses) and if the packet was detected soon after another similar UDP packet.<br><br>If the software detects no UDP packets for the UDP session for the period of time defined by the UDP idle timeout, the software will not continue to manage state information for the session. |
| DNS Timeout (seconds)                                                                     | The length of time for which a DNS lookup session is managed while there is no activity, in seconds, from 1-2147483. The default is 5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>SYN Flooding DoS Attack Thresholds</b>                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Maximum 1 Minute Connection Rate - low<br>Maximum 1 Minute Connection Rate - high         | The number of new unestablished sessions that causes the system to start and stop deleting half-open sessions. Ensure that you enter a lower number in the Low field than you enter in the High field. Possible values are from 1-2147483647 per minute. The default is 400 for low and 500 for high.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Maximum Incomplete Sessions Stop Threshold<br>Maximum Incomplete Sessions Start Threshold | The number of existing half-open sessions that will cause the software to start and stop deleting half-open sessions. Ensure that you enter a lower number in the stop field than you enter in the start field. Possible values are from 1-2147483647. The default is 400 for low and 500 for high.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Thresholds per Host</b>                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Max Sessions Per Host                          | <p>The number of half-open TCP sessions with the same host destination address that can exist at a time before the software starts deleting half-open sessions to the host. Possible values are 1-4294967295. The default is 50.</p> <p>A large number of half-open sessions can indicate there is a Denial of Service attack against the host.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Max Sessions Blocking Interval (min)           | <p>If the maximum sessions per host threshold is reached, the blocking time to apply to help mitigate the potential TCP host-specific denial-of-service (DoS) attack. Possible values are 0-35791 minutes. The default is 0.</p> <ul style="list-style-type: none"> <li>• If the blocking time value is 0, the software deletes the oldest existing half-open session for the host for every new connection request to the host above the maximum session limit. This ensures that the number of half-open sessions to a given host will never exceed the threshold.</li> <li>• If the blocking time value is greater than 0, the software deletes all existing half-open sessions for the host, then blocks all new connection requests to the host. The software will continue to block all new connection requests until the block-time expires.</li> </ul> |
| <b>Other</b>                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Session Hash Table Size (buckets)              | <p>The size of the hash table in terms of buckets. Possible values for the hash table are 1024, 2048, 4096, and 8192. The default is 1024.</p> <p>You should increase the hash table size when the total number of sessions running through the device is approximately twice the current hash size; decrease the hash table size when the total number of sessions is reduced to approximately half the current hash size. Essentially, try to maintain a 1:1 ratio between the number of sessions and the size of the hash table.</p>                                                                                                                                                                                                                                                                                                                        |
| Enable Alert Messages                          | Whether to generate stateful packet inspection alert messages on the console.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Enable Audit Trail Messages                    | Whether audit trail messages are logged to the syslog server or router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Permit DHCP Passthrough (Transparent Firewall) | <p>Whether to permit a transparent firewall to forward DHCP packets across the bridge without inspection.</p> <p>Permitting DHCP passthrough overrides an ACL for DHCP packets, so DHCP packets are forwarded even if the ACL is configured to deny all IP packets. Thus, clients on one side of the bridge can get an IP address from a DHCP server on the opposite side of the bridge.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Block Non-SYN Packets                          | Whether to drop TCP packets that do not belong to an established session. These are TCP packets that do not initiate sessions, that is, the SYN bit is not set in them.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Log Dropped Packets                            | Whether to create log messages for dropped packets to specify the reason for dropping them.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Managing Firewall Web Filter Rules

---

Web filter rules policies define policies for allowing or preventing web traffic based on the requested URL or the applet content of the traffic. For ASA, PIX, and FWSM devices, you can also filter FTP and HTTPS traffic.

How you configure web filter rules is different depending on whether the device uses ASA, PIX or FWSM software as opposed to Cisco IOS Software.

The following topics help you work with web filter rules:

- [Understanding Web Filter Rules, page 18-1](#)
- [Configuring Web Filter Rules for ASA, PIX, and FWSM Devices, page 18-2](#)
- [Configuring Web Filter Rules for IOS Devices, page 18-10](#)

## Understanding Web Filter Rules

Web filter rules policies define policies for allowing or preventing web traffic based on the requested URL or the applet content of the traffic. For ASA, PIX, and FWSM devices, you can also filter FTP and HTTPS traffic.

Web, or URL, filtering allows you to control which web sites and web content your users have access to. For example, you might consider some types of content to create a hostile work environment for the people in your organization (for example, web sites that provide pornography). You might consider some web sites to be unsafe and a source of potential viral applications. Using web filter rules, you can block access to these objectionable or unsafe sites.

To filter web requests, you should install an external web filtering server, either Websense or SmartFilter (N2H2). For ASA, PIX, and FWSM devices, these external servers are required for URL, FTP, or HTTPS filtering. For IOS devices, you can also use these servers, but additionally you can create local lists of whitelisted (always allowed) or blacklisted (always denied) URLs. You configure the filtering servers in the web filter settings policy; see [Configuring Settings for Web Filter Servers, page 18-15](#).

Tip

---

For IOS devices, you have the option of configuring web filtering using zone-based firewall rules instead of web filter rules, which allows you the additional option of using Trend Micro web filtering servers. For more information, see [Chapter 21, “Managing Zone-based Firewall Rules”](#).

---

Beside filtering requests based on URL, you can do some applet filtering, stripping out ActiveX or Java applets. You might want to do this to prevent applet downloads from sites you otherwise want to allow if you do not fully trust the site. You can configure your rules to block these applets from specific sites while allowing them from trusted sites.

The policies and procedures for configuring web filter rules differs based on the device type. See the following topics for more information:

- [Configuring Web Filter Rules for ASA, PIX, and FWSM Devices, page 18-2](#)
- [Configuring Web Filter Rules for IOS Devices, page 18-10](#)

## Configuring Web Filter Rules for ASA, PIX, and FWSM Devices

Web filter rules policies for ASA, PIX, and FWSM devices define how you want to handle HTTP, FTP, and HTTPS traffic. You can also filter ActiveX and Java applets. Web filter rules permit or deny traffic based on the Universal Resource Locator (URL) address in the web request. If you allow HTTP traffic in your access rules, you can subsequently deny (or drop) traffic if it is directed at an objectionable web or FTP site, or you can strip out ActiveX or Java applets from untrusted sources.

To configure web filtering rules for ASA, PIX, and FWSM devices:

1. Configure the rules that identify traffic that should be subject to filtering, and the traffic that should be exempt from filtering rules (see below for the procedure).
2. Configure web filter settings to identify the URL filtering server and other settings. For more information, see [Configuring Settings for Web Filter Servers, page 18-15](#).

### Related Topics

- [Understanding Web Filter Rules, page 18-1](#)
- [Using Sections to Organize Rules Tables, page 12-20](#)
- [Adding and Removing Rules, page 12-9](#)

- [Moving Rules and the Importance of Rule Order, page 12-19](#)
- [Understanding Networks/Hosts Objects, page 6-74](#)
- [Understanding and Specifying Services and Service and Port List Objects, page 6-86](#)

- 
- Step 1** Do one of the following to open the [Web Filter Rules Page \(ASA/PIX/FWSM\), page 18-3](#):
- Device view—Select **Firewall > Web Filter Rules** from the Policy selector.
  - Policy view—Select **Firewall > Web Filter Rules (PIX/FWSM/ASA)** from the Policy Type select. Select an existing policy or create a new one.
- Step 2** Select the row after which you want to create the rule and click the **Add Row** button or right-click and select **Add Row**. This opens the [Add and Edit PIX/ASA/FWSM Web Filter Rule Dialog Boxes, page 18-5](#).

**Tip**

If you do not select a row, the new rule is added at the end of the local scope. You can also select an existing row and edit either the entire row or specific cells. For more information, see [Editing Rules, page 12-9](#).

**Step 3** Configure the rule. Following are the highlights of what you typically need to decide. For specific information on configuring the fields, see [Add and Edit PIX/ASA/FWSM Web Filter Rule Dialog Boxes, page 18-5](#).

- Filtering and Type—Whether you are creating a rule that identifies traffic to be filtered (Filter) or exempted from an existing filter rule (Filter Except), and the type of filtering to be done:
  - URL—To filter traffic based on web address.
  - HTTPS—To filter web traffic to secure sites. This does not include SSL VPN traffic.
  - FTP—To filter FTP traffic.
  - ActiveX or Java—To remove ActiveX or Java applets. These options delete all entities within applet or object tags, so you might remove more than just ActiveX or Java applets.
- Source and Destination addresses—If the rule should apply no matter which addresses generated the traffic or their destinations, use “any” as the source or destination. If the rule is specific to a host or network, enter the addresses or network/host objects. For information on the accepted address formats, see [Specifying IP Addresses During Policy Definition, page 6-81](#).
- Service—Primarily defines the port that should be monitored. You must specify some type of TCP service. Typically, you would use the pre-defined services HTTP, HTTPS, or FTP, which should be the same as the type of filtering you are performing, but you can specify any TCP port on your network that might contain the traffic to be filtered.
- Options—The options you want to include, if any. The main options of interest are whether you want to allow traffic if the filtering servers are unavailable, and whether you want to truncate long URLs or URLs that have parameters. Truncating URLs that have parameters is typically a good idea, because if you are going to drop a URL, it is not normally because of a parameter value.

Click **OK** when you are finished defining your rule.

**Step 4** If you did not select the desired row before adding the rule, select the new rule and use the up and down arrow buttons to position the rule appropriately. Order is not as important for web filtering rules, however, because filter except rules always create exceptions to the related filter rule, whether they come before or after the filter rule. For more information, see [Moving Rules and the Importance of Rule Order, page 12-19](#).

## Web Filter Rules Page (ASA/PIX/FWSM)

Use the Web Filter Rules page for ASA, PIX, and FWSM devices to configure web, or URL, filtering rules. Web filtering is a type of HTTP inspection. If your access rules allow HTTP traffic, you can configure rules to apply server-based web filtering to prevent users from accessing undesirable web servers.

When you configure web filter rules, also configure web filter settings in the **Firewall > Settings > Web Filter** policy. The settings identify the web filtering server and contain other settings that control the overall functioning of the policy. You must configure a web filtering server for your URL, FTP, or HTTPS filter rules to be deployed. For more information, see [Web Filter Settings Page, page 18-16](#).

**Tip**

Rules cannot overlap. For example, if you create two rules with the same, or overlapping, source, destination, and service, you cannot deploy them. Also, you should order any filter-except rules below the filter rule to which they are creating an exemption.

**Navigation Path**

To access the Web Filter Rules page for ASA, PIX, and FWSM devices, do one of the following:

- (Device view) Select an ASA, PIX, or FWSM device, then select **Firewall > Web Filter Rules** from the Policy selector.
- (Policy view) Select **Firewall > Web Filter Rules (PIX/FWSM/ASA)** from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click an ASA, PIX, or FWSM device and select **Edit Firewall Policies > Web Filter Rules**.

**Table 18-1** Web Filter Rules Page (ASA, PIX, FWSM)

| Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.                   | The ordered rule number.                                                                                                                                                                                                                                                                                                                                                                                    |
| Source<br>Destination | The source and destination addresses for the rule. The “any” address does not restrict the rule to specific hosts, networks, or interfaces. These addresses are IP addresses for hosts or networks, network/host objects, interfaces, or interface roles. Multiple entries are displayed as separate subfields within the table cell. See <a href="#">Understanding Networks/Hosts Objects, page 6-74</a> . |
| Service               | The services or service objects that specify the protocol and port of the traffic to which the rule applies. Multiple entries are displayed as separate subfields within the table cell. See <a href="#">Understanding and Specifying Services and Service and Port List Objects, page 6-86</a> .                                                                                                           |
| Type                  | The type of filtering action for the rule, either filtering the identified traffic, or exempting the identified traffic from filtering (Filter Except). For a full explanation, see <a href="#">Edit Web Filter Type Dialog Box, page 18-8</a> .                                                                                                                                                            |

**Table 18-1 Web Filter Rules Page (ASA, PIX, FWSM) (Continued)**

| Element                                   | Description                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Options                                   | Additional configuration options for the selected protocol, if any. For detailed descriptions, see <a href="#">Edit Web Filter Options Dialog Box</a> , page 18-9.                                                                                                                                                                                                                       |
| Category                                  | The category assigned to the rule. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , page 6-12.                                                                                                                                                                                                                                  |
| Description                               | The description of the rule, if any.                                                                                                                                                                                                                                                                                                                                                     |
| Last Ticket(s)                            | Shows the ticket(s) associated with last modification to the rule. You can click the ticket ID in the Last Ticket(s) column to view details of the ticket and to navigate to the ticket. If linkage to an external ticket management system has been configured, you can also navigate to that system from the ticket details (see <a href="#">Ticket Management Page</a> , page 11-51). |
| Tools button                              | Click this button to select tools that you can use with this type of policy. You can select from the following tools: <ul style="list-style-type: none"> <li>Query—To run policy queries, which can help you evaluate your rules and identify ineffective rules that you can delete. See <a href="#">Generating Policy Query Reports</a>, page 12-28</li> </ul>                          |
| Find and Replace button (binoculars icon) | Click this button to search for various types of items within the table and to optionally replace them. See <a href="#">Finding and Replacing Items in Rules Tables</a> , page 12-16.                                                                                                                                                                                                    |
| Up Row and Down Row buttons (arrow icons) | Click these buttons to move the selected rules up or down within a scope or section. For more information, see <a href="#">Moving Rules and the Importance of Rule Order</a> , page 12-19.                                                                                                                                                                                               |
| Add Row button                            | Click this button to add a rule to the table after the selected row using the <a href="#">Add and Edit PIX/ASA/FWSM Web Filter Rule Dialog Boxes</a> , page 18-5. If you do not select a row, the rule is added at the end of the local scope. For more information about adding rules, see <a href="#">Adding and Removing Rules</a> , page 12-9.                                       |
| Edit Row button                           | Click this button to edit the selected rule. You can also edit individual cells. For more information, see <a href="#">Editing Rules</a> , page 12-9.                                                                                                                                                                                                                                    |
| Delete Row button                         | Click this button to delete the selected rule.                                                                                                                                                                                                                                                                                                                                           |

## Add and Edit PIX/ASA/FWSM Web Filter Rule Dialog Boxes

Use the Add and Edit PIX/ASA/FWSM Web Filter Rule dialog boxes to configuring web filtering rules for these types of devices.

### Navigation Path

From the [Web Filter Rules Page \(ASA/PIX/FWSM\)](#), page 18-3, click the **Add Row** button or select a row and click the **Edit Row** button.

| Enable Rule | Whether to enable the rule, which means the rule becomes active when you deploy the configuration to the device. Disabled rules are shown overlain with hash marks in the rule table. For more information, see <a href="#">Enabling and Disabling Rules, page 12-20</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Filtering   | The type of rule you are defining: <ul style="list-style-type: none"> <li>• Filter—The rule filters the identified type of traffic between source and destination.</li> <li>• Filter Except—The rule creates an exemption to a filter rule. The identified traffic between the source and destination is not filtered.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Type        | The type of traffic that should be filtered (or exempted from filtering) for this rule. For filtering that uses an external server, consult the documentation for your version of the server to determine if it supports that type of filtering. Configure the filtering server on the <a href="#">Web Filter Settings Page, page 18-16</a> . <ul style="list-style-type: none"> <li>• URL—HTTP traffic. Filtering is done using an external filtering server.</li> <li>• HTTPS—HTTPS traffic. This does not include traffic associated with an SSL VPN. Filtering is done using an external filtering server.</li> <li>• Java—Remove Java applets from HTTP traffic if they are identified on applet tags. The rule does not remove Java applets from SSL VPN traffic. If the applet tag spans packets, or the code in the tags is larger than the MTU, the Java applet is not removed.</li> <li>• ActiveX—Remove ActiveX or Java applets from HTTP traffic. The rule removes any item within object or applet tags, which might also remove images and multimedia objects. The rule might not remove applets from SSL VPN traffic. If the object tag spans packets, or the code in the tags is larger than the MTU, the object is not removed.</li> <li>• FTP—FTP traffic. Filtering is done using an external filtering server.</li> </ul> |

**Table 18-2 Add and Edit PIX/ASA/FWSM Web Filter Rule Dialog Boxes (Continued)**

| Element                                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sources<br>Destinations                                                    | <p>The source or destination of the traffic. You can enter more than one value by separating the items with commas.</p> <p>You can enter any combination of the following address types to define the source or destination of the traffic. For more information, see <a href="#">Specifying IP Addresses During Policy Definition, page 6-81</a>.</p> <ul style="list-style-type: none"> <li>• Network/host object. Enter the name of the object or click <b>Select</b> to select it from a list. You can also create new network/host objects from the selection list.</li> <li>• Host IP address, for example, 10.10.10.100.</li> <li>• Network address, including subnet mask, in either the format 10.10.10.0/24 or 10.10.10.0/255.255.255.0.</li> <li>• A range of IP addresses, for example, 10.10.10.100-10.10.10.200.</li> <li>• An IP address pattern in the format 10.10.0.10/255.255.0.255, where the mask is a discontinuous bit mask (see <a href="#">Contiguous and Discontinuous Network Masks for IPv4 Addresses, page 6-75</a>).</li> </ul> |
| Services                                                                   | <p>The services that define the port number of the traffic to act on. You can enter more than one value by separating the items with commas.</p> <p>The service must use TCP. Your specification defines the port that you want filtered (the service name has no meaning). For example, if you want to filter port 80, use the HTTP service object. If HTTP traffic on your network uses a different port, specify TCP/port number (for example, TCP/8080). You can enter TCP by itself to filter all ports.</p> <p>You can enter any combination of service objects and service types (which are typically a protocol and port combination). If you type in a service, you are prompted as you type with valid values. You can select a value from the list and press Enter or Tab.</p> <p>For complete information on how to specify services, see <a href="#">Understanding and Specifying Services and Service and Port List Objects, page 6-86</a>.</p>                                                                                                 |
| Allow traffic if URL Filter Server unavailable<br>(URL, FTP, HTTPS only)   | Whether to permit unfiltered traffic on outbound connections if all of the URL filtering servers are unavailable. If you do not select this option, all affected outbound traffic (HTTP, FTP, or HTTPS) is blocked until at least one filtering server becomes available.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Block connection to HTTP Proxy Server<br>(URL only)                        | Whether to prevent users from connecting to an HTTP proxy server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Truncate CGI request by removing CGI parameters<br>(URL only)              | When a URL has a parameter list starting with a question mark (?), such as a CGI script, whether to truncate the URL sent to the filtering server by removing all characters after and including the question mark.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Block outbound requests if absolute FTP path is not provided<br>(FTP only) | Whether to prevent interactive FTP sessions that do not provide the entire directory path when the user tries to change directories.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Table 18-2 Add and Edit PIX/ASA/FWSM Web Filter Rule Dialog Boxes (Continued)**

| Element                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Long URL<br>(URL only) | How to handle URLs that are longer than the maximum allowed by the filtering server: 4 KB for Websense, 3 KB for Smartfilter (N2H2). Many times, long URLs are due to parameter lists, and you can use the <b>Truncate CGI request by removing CGI parameters</b> option to handle those URLs. For other long URLs, select from the following options: <ul style="list-style-type: none"> <li>• Drop—Drop the long URL request.</li> <li>• Truncate—Truncate the URL request to only the hostname or IP address portion of the URL.</li> <li>• Deny—Deny the URL request.</li> </ul> |
| Category               | The category assigned to the rule. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-12</a> .                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Description            | An optional description of the rule (up to 1024 characters).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Edit Web Filter Type Dialog Box

Use the Edit Web Filter Type dialog box to edit the type of filtering to be done by a web filter rule for ASA, PIX, and FWSM devices.

### Navigation Path

Right-click the Type cell in a web filter rule for ASA/PIX/FWSM (on the [Web Filter Rules Page \(ASA/PIX/FWSM\), page 18-3](#)) and select **Edit Web Filter Type**. You can edit the type for one row at a time.

|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type    | <p>The type of traffic that should be filtered (or exempted from filtering) for this rule. For filtering that uses an external server, consult the documentation for your version of the server to determine if it supports that type of filtering. Configure the filtering server on the <a href="#">Web Filter Settings Page, page 18-16</a>.</p> <ul style="list-style-type: none"> <li>• URL—HTTP traffic. Filtering is done using an external filtering server.</li> <li>• HTTPS—HTTPS traffic. This does not include traffic associated with an SSL VPN. Filtering is done using an external filtering server.</li> <li>• Java—Remove Java applets from HTTP traffic if they are identified on applet tags. The rule does not remove Java applets from SSL VPN traffic. If the applet tag spans packets, or the code in the tags is larger than the MTU, the Java applet is not removed.</li> <li>• ActiveX—Remove ActiveX or Java applets from HTTP traffic. The rule removes any item within object or applet tags, which might also remove images and multimedia objects. The rule might not remove applets from SSL VPN traffic. If the object tag spans packets, or the code in the tags is larger than the MTU, the object is not removed.</li> <li>• FTP—FTP traffic. Filtering is done using an external filtering server.</li> </ul> |

## Edit Web Filter Options Dialog Box

Use the Edit Web Filter Options dialog box to edit the filtering options defined for a web filter rule for ASA, PIX, and FWSM devices.

The options displayed on this dialog box differ depending on the type of filtering configured for the rule. For some types, there are no options and the dialog box is empty. The reference table below includes all possible options.

### Navigation Path

Right-click the Options cell in a web filter rule for ASA/PIX/FWSM (on the [Web Filter Rules Page \(ASA/PIX/FWSM\), page 18-3](#)) and select **Edit Web Filter Type**. You can edit the type for one row at a time.

| Element                                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Block connection to HTTP Proxy Server<br>(URL only)                        | Whether to prevent users from connecting to an HTTP proxy server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Truncate CGI request by removing CGI parameters<br>(URL only)              | When a URL has a parameter list starting with a question mark (?), such as a CGI script, whether to truncate the URL sent to the filtering server by removing all characters after and including the question mark.                                                                                                                                                                                                                                                                                                                                                                  |
| Block outbound requests if absolute FTP path is not provided<br>(FTP only) | Whether to prevent interactive FTP sessions that do not provide the entire directory path when the user tries to change directories.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Long URL<br>(URL only)                                                     | How to handle URLs that are longer than the maximum allowed by the filtering server: 4 KB for Websense, 3 KB for Smartfilter (N2H2). Many times, long URLs are due to parameter lists, and you can use the <b>Truncate CGI request by removing CGI parameters</b> option to handle those URLs. For other long URLs, select from the following options: <ul style="list-style-type: none"> <li>• Drop—Drop the long URL request.</li> <li>• Truncate—Truncate the URL request to only the hostname or IP address portion of the URL.</li> <li>• Deny—Deny the URL request.</li> </ul> |

## Configuring Web Filter Rules for IOS Devices

Web filter rules policies for IOS devices define how you want to handle HTTP traffic. The web filter rules are a type of inspection rule that permits or denies traffic based on the Universal Resource Locator (URL) address in the web request. If you allow HTTP traffic on an interface in your access rules, you can subsequently deny (or drop) traffic if it is directed at an objectionable web site.

To configure web filtering rules for IOS devices:

1. Configure the interfaces that should filter web traffic (see below for the procedure).
2. Configure the local web filtering list to identify web sites that should always be permitted or denied (see below for the procedure).
3. Configure web filter settings to identify the URL filtering server and other settings. For more information, see [Configuring Settings for Web Filter Servers, page 18-15](#).

Tip

You can also configure web filtering as a zone based firewall rule. For more information, see [Adding Zone-Based Firewall Rules, page 21-12](#).

### Related Topics

- [Understanding Web Filter Rules, page 18-1](#)
- [Understanding Interface Role Objects, page 6-67](#)

- [Understanding Networks/Hosts Objects, page 6-74](#)

- 
- Step 1** Do one of the following to open the [Web Filter Rules Page \(IOS\), page 18-11](#):
- Device view—Select **Firewall > Web Filter Rules** from the Policy selector.
  - Policy view—Select **Firewall > Web Filter Rules (IOS)** from the Policy Type select. Select an existing policy or create a new one.
- Step 2** Configure the interfaces on which you will filter HTTP traffic. Create rules for each interface on which you will enable filtering:
- a. Select the Web Filter Rules tab if it is not already selected and do one of the following to open the [IOS Web Filter Rule and Applet Scanner Dialog Box, page 18-13](#):
    - To create a new rule, right-click inside the work area and select **Add Row**.
    - To edit an existing rule, right-click the rule and select **Edit Row**.
  - b. Identify the interface for which this rule applies. You can either enter the interface name or click **Select** to select it or an interface role from the list. Also configure the following:
    - Traffic direction with respect to the interface—Typically, you want to select **In** so that undesired traffic is dropped before the device spends more time processing the packet.
    - Java applet scanning—If you enable web filtering on an interface, Java applets are inspected, which can affect performance. Typically, you want to enable Java applet scanning so that you can identify permitted and denied sources and avoid the scanning of denied applets. If you want to configure both permitted and denied sources for an interface, you must configure two rules for the interface.
  - c. Click **OK** to add the rule to the web filtering rules table.
- Step 3** (Optional) Configure the list of exclusive domains, which define the local filtering list. This list is applied before web requests are sent to the external web filtering server (defined on the [Web Filter Settings Page, page 18-16](#)). If you know there are web sites that you will always permit (such as your organization's web site) or deny, configure them in the local list. Configure as many rules as needed to define the complete list.
- a. Click the **Exclusive Domains** tab and do one of the following to open the [IOS Web Filter Exclusive Domain Name Dialog Box, page 18-14](#).
    - To create a new rule, right-click inside the work area and select **Add Row**.
    - To edit an existing rule, right-click the rule and select **Edit Row**.
  - b. Select whether you are permitting or denying the specified domains, and enter the domain names or host IP addresses. You can enter either full domain names (the names of specific web sites) or partial names (for entire domains you want to treat the same way).
  - c. Click **OK** to add your exclusive domain rule to the policy.
- 

## Web Filter Rules Page (IOS)

Use the Web Filter Rules page for IOS devices to configure web, or URL, filtering rules. Web filtering is a type of HTTP inspection. If your access rules allow HTTP traffic on an interface, you can configure rules to apply local and server-based web filtering to prevent users from accessing undesirable web servers.

When you configure web filter rules, also configure web filter settings in the **Firewall > Settings > Web Filter** policy. The settings identify the web filtering server and contain other settings that control the overall functioning of the policy. For example, you can use the settings policy to allow all web traffic if the filtering server becomes unavailable. For more information, see [Web Filter Settings Page, page 18-16](#).

**Tip**

You can also configure web filtering as a zone based firewall rule. For more information, see [Zone-based Firewall Rules Page, page 21-57](#).

**Navigation Path**

To access the Web Filter Rules page for IOS devices, do one of the following:

- (Device view) Select an IOS device and select **Firewall > Web Filter Rules** from the Policy selector.
- (Policy view) Select **Firewall > Web Filter Rules (IOS)** from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click an IOS device and select **Edit Firewall Policies > Web Filter Rules**.

| Element                                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Java Applet Scanning<br>Enable Java Applet Scanner | <p>If you select <b>Enable Java Applet Scanning</b>, the device checks for the presence of Java applets in HTTP traffic coming from web servers to internal hosts. If a Java applet is present and the web server (applet source) is in the list of permitted sources, the Java applet is left unmodified in the HTTP traffic. Otherwise, the Java applets are removed from HTTP pages.</p> <p><b>Tip</b> When you enable web filtering, Java applets are inspected, which can affect performance. By enabling the Java applet scanner, you can identify a list of permitted or denied sources and avoid inspection for those applets. Even if you do not want to deny any sources, enable scanning and permit the <b>any</b> source.</p>                                                                                                     |
| Permit Traffic<br>Applet Sources                   | <p>The list of permitted or denied source addresses for Java applets. To configure a list of permitted or denied sources:</p> <ul style="list-style-type: none"> <li>• Select either <b>Permit from Specified Sources</b> or <b>Deny from Specified Sources</b>. If you want to create both a permit and deny list, create two separate web filter rules. If you do not configure a permit list, all sources are denied.</li> <li>• Enter the list of permitted or denied addresses in the <b>Applet Sources</b> field. The list can include host IP addresses, network addresses, address ranges, or network/host objects, but cannot include domain names. Separate multiple addresses with commas. For more information on entering addresses, see <a href="#">Specifying IP Addresses During Policy Definition, page 6-81</a>.</li> </ul> |

## IOS Web Filter Exclusive Domain Name Dialog Box

Use the IOS Web Filter Exclusive Domain Name dialog box to configure local web filtering rules for IOS devices. You can create a list of permitted or denied domain names or IP addresses. The device checks this list before forwarding web requests to your web filtering server.

Using local filtering saves the wait time for getting a response from the server when a user requests a web site that you know you will either always permit or always deny.

### Navigation Path

To open this dialog box, select the Exclusive Domains tab on the [Web Filter Rules Page \(IOS\)](#), [page 18-11](#), click **Add Row** to create a new rule, or select a row and click **Edit Row** to edit an existing rule.

| Element     | Description                                                                                                                                                                                                                                                                                                                  |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Traffic     | Whether you want to permit access to the listed web sites or deny access to them.                                                                                                                                                                                                                                            |
| Domain Name | The domain names or host IP addresses of web sites that you are permitting or denying. Separate multiple entries with commas.<br><br>For domain names, you can enter a full or partial name. For example, cisco.com covers all web servers on the cisco.com domain, whereas www.cisco.com specifies only the www web server. |

## Configuring Settings for Web Filter Servers

Use the Web Filter settings policy to configure the web filter servers and other settings to use with your web filter rules policy. You can use Websense or Smartfilter (N2H2) filtering servers, or no external servers (for IOS devices).

You must install and configure the web filter servers as directed by the documentation for the server before configuring and deploying this policy. Security Manager cannot confirm that the servers exist or that they are configured correctly.

**Tip**

These settings work only with the web filter rules policy. The web servers you configure here are not used with zone based firewall rules policies that configure web content filtering.

**Related Topics**

- [Understanding Web Filter Rules, page 18-1](#)
- [Configuring Web Filter Rules for ASA, PIX, and FWSM Devices, page 18-2](#)
- [Configuring Web Filter Rules for IOS Devices, page 18-10](#)

- 
- Step 1** Do one of the following to open the [Web Filter Settings Page, page 18-16](#):
- (Device view) Select **Firewall > Settings > Web Filter** from the Policy selector.
  - (Policy view) Select **Firewall > Settings > Web Filter** from the Policy Type selector. Select an existing policy or create a new one.
- Step 2** Select the type of web filtering server you use in the **Web Filter Server Type** field, and then add the servers to the table of web filtering servers. If you have more than one server, add them in priority order; the first server in the list is the primary server.
- To add a server, click the Add Row button and fill in the [Web Filter Server Configuration Dialog Box, page 18-19](#).
  - To edit a server, select it and click the Edit Row button.
  - To delete a server, select it and click the Delete Row button.
- Step 3** The bottom half of the settings policy includes device-specific options that you can also configure. For specific information on each setting, see [Web Filter Settings Page, page 18-16](#). The following is an overview of the settings:

- IOS devices—The most interesting setting is **Allow Traffic when Servers Unreachable**, which determines whether you allow any web connections if the filtering servers are unavailable. If you do not select this option, all web traffic is cut off if the servers go offline for any reason.

The remaining settings configure logging and cache size options.

- ASA, PIX, FWSM devices—These options configure the cache size and buffer limits used with the filtering servers. You can also control whether the cached responses include both source and destination (if you have different filtering policies per user) or destination only (one policy for all), as configured in the filtering server.

---

## Web Filter Settings Page

Use the Web Filter settings page to configure the web filter servers and other settings to use with your web filter rules policy.

You must install and configure the web filter servers as directed by the documentation for the server before configuring and deploying this policy. Security Manager cannot confirm that the servers exist or that they are configured correctly.

**Tip**

---

These settings work only with the web filter rules policy. The web servers you configure here are not used with zone based firewall rules policies that configure web content filtering.

---

### Navigation Path

To access the Web Filter settings page, do one of the following:

- (Device view) Select a device, then select **Firewall > Settings > Web Filter** from the Policy selector.
- (Policy view) Select **Firewall > Settings > Web Filter** from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click a device and select **Edit Firewall Settings > Web Filter**.

| Element                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maximum Requests                                       | The maximum number of outstanding requests that can exist at any given time. If the specified number is exceeded, new requests are dropped. The default is 1000.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Packet Buffer                                          | <p>The maximum number of HTTP responses that can be stored in the packet buffer of the device while it waits for the web filter server to allow or deny the request. The device drops responses when the maximum is reached. The default (and maximum) value is 200.</p> <p>When users make web requests, the device simultaneously sends the request to the web site and to the web filtering server. If the response from the web site is received before the server provides a permit or deny response, the device keeps the request in the packet buffer until it gets a response from the server.</p> <p>The response is removed from the buffer when the server responds or if the device determines that the server is unavailable and you also selected <b>Allow Traffic when Servers Unreachable</b>.</p> |
| <b>PIX/ASA/FWSM Specific Settings</b>                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Cache Match Criteria                                   | <p>How to cache web requests:</p> <ul style="list-style-type: none"> <li>• Source and Destination—Cache entries are based on both the address initiating the request and the destination web address. Select this mode if users do not share the same filtering policy on the filtering server.</li> <li>• Destination—Cache entries are based on the destination web address. Select this mode if all users share the same filtering policy on the filtering server.</li> </ul>                                                                                                                                                                                                                                                                                                                                   |
| URL Buffer Memory<br>(ASA 7.2+, PIX 7.2+ only.)        | The size of the URL buffer memory pool in KB. Values are 2 to 10240.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Maximum Allowed URL Size<br>(ASA 7.2+, PIX 7.2+ only.) | <p>The maximum allowed URL size in KB for each URL being buffered. The possible values differ depending on server type:</p> <ul style="list-style-type: none"> <li>• Websense—From 2 to 4.</li> <li>• Smartfilter (N2H2)—2 or 3.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Cache Size                                             | <p>The size of the cache, in KB, for storing responses from the filtering server. Values are 1 to 128.</p> <p>Caching stores URL access privileges in memory on the security appliance. When a host requests a connection, the security appliance first looks in the URL cache for matching access privileges instead of forwarding the request to the Websense server.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| URL Block Buffer Limit                                 | The size of the buffer for storing web server responses while waiting for a filtering decision from the filtering server. The values are 1 to 128, which specifies the number of 1550-byte blocks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Web Filter Server Configuration Dialog Box

Use the Web Filter Server Configuration dialog box to configure the external web filter servers you want to use with your Web Filter Rules policies. You can configure Websense or Smartfilter (N2H2) servers.

### Navigation Path

From the [Web Filter Settings Page, page 18-16](#), click **Add Row** beneath the Web Filter Servers table, or select a row and click **Edit Row**.

| IP Address                            | The IP address of the web filter server.                                                                                                                                                                                                                                                                                                                                      |
| Timeout                               | The length of time, in seconds, that the device will wait for a response from the web filter server. The default is 5 seconds.<br><br>If the request times out, the device tries the next server, if you configure more than one.                                                                                                                                             |
| <b>PIX/ASA/FWSM Specific Settings</b> |                                                                                                                                                                                                                                                                                                                                                                               |
| Interface                             | The network interface where the authentication server resides, for example, FastEthernet0. If not specified, the default is inside.<br><br>Enter the name of the interface or the interface role that identifies it, or click <b>Select</b> to select the interface or role from a list, or to create a new role. An interface must already be defined to appear on the list. |
| Protocol                              | The protocol to use when communicating with the web filtering server. Select the option for which the server is configured: <ul style="list-style-type: none"> <li>• TCP (version 1)</li> <li>• TCP version 4</li> <li>• UDP version 4</li> </ul>                                                                                                                             |
| Connection Number                     | (Optional) The maximum number of TCP connections allowed between the device and the server.                                                                                                                                                                                                                                                                                   |
| <b>IOS Specific Settings</b>          |                                                                                                                                                                                                                                                                                                                                                                               |
| Retransmit                            | The number of times the device will retransmit a request when the server does not respond. The default value is two times.                                                                                                                                                                                                                                                    |
| Port                                  | The port number that the server listens on. The default port is 15868.                                                                                                                                                                                                                                                                                                        |

## CHAPTER 19

# Managing Firewall Botnet Traffic Filter Rules

---

Malware is malicious software that is installed on an unknowing host. Malware that attempts network activity such as sending private data (passwords, credit card numbers, key strokes, or proprietary data) can be detected by the Botnet Traffic Filter when the malware starts a connection to a known bad IP address. The Botnet Traffic Filter checks incoming and outgoing connections against a dynamic database of known bad domain names and IP addresses, and then logs any suspicious activity.

You can also supplement the Cisco dynamic database with blacklisted addresses of your choosing by adding them to a static blacklist; if the dynamic database includes blacklisted addresses that you think should not be blacklisted, you can manually enter them into a static whitelist. Whitelisted addresses still generate syslog messages, but because you are only targeting blacklist syslog messages, they are informational. If you do not want to use the Cisco dynamic database at all, because of internal requirements, you can use the static blacklist alone if you can identify all the malware sites that you want to target.

### Related Topics

- [Task Flow for Configuring the Botnet Traffic Filter, page 19-2](#)
- [Botnet Traffic Filter Rules Page, page 19-9](#)

## Understanding Botnet Traffic Filtering

### Botnet Traffic Filter Address Categories

Addresses monitored by the Botnet Traffic Filter include:

- **Known malware addresses**—These addresses are on the blacklist identified by the dynamic database and the static blacklist.
- **Known allowed addresses**—These addresses are on the whitelist. To be whitelisted, an address must be blacklisted by the dynamic database and also identified by the static whitelist.
- **Ambiguous addresses**—These addresses are associated with multiple domain names, but not all of these domain names are on the blacklist. These addresses are on the graylist.
- **Unlisted addresses**—These addresses are unknown, and not included on any list.

### Botnet Traffic Filter Actions for Known Addresses

You can configure the Botnet Traffic Filter to log suspicious activity, and you can optionally configure it to block suspicious traffic automatically.

Unlisted addresses do not generate any syslog messages, but addresses on the blacklist, whitelist, and graylist generate syslog messages differentiated by type.

### Botnet Traffic Filter Databases

The Botnet Traffic Filter uses two databases for known addresses. You can use both databases together, or you can disable use of the dynamic database and use the static database alone. This section includes the following topics:

- Information About the Dynamic Database
- Information About the Static Database

### Information About the Dynamic Database

The Botnet Traffic Filter can receive periodic updates for the dynamic database from the Cisco update server. This database lists thousands of known bad domain names and IP addresses.

The security appliance uses the dynamic database as follows:

1. When the domain name in a DNS reply matches a name in the dynamic database, the Botnet Traffic Filter adds the name and IP address to the DNS reverse lookup cache.
2. When the infected host starts a connection to the IP address of the malware site, the security appliance sends a syslog message informing you of the suspicious activity.
3. In some cases, the IP address itself is supplied in the dynamic database, and the Botnet Traffic Filter logs any traffic to that IP address without having to inspect DNS requests.

#### Note

To use the database, be sure to configure a domain name server for the security appliance so that it can access the URL.

To use the domain names in the dynamic database, you need to enable DNS packet inspection with Botnet Traffic Filter snooping; the security appliance looks inside the DNS packets for the domain name and associated IP address.

### Information About the Static Database

You can manually enter domain names or IP addresses (host or subnet) that you want to tag as bad names in a blacklist. You can also enter names or IP addresses in a whitelist, so that names or addresses that appear on both the whitelist and the dynamic blacklist are identified only as whitelist addresses in syslog messages and reports.

You can alternatively enable DNS packet inspection with Botnet Traffic Filter snooping. With DNS snooping, when an infected host sends a DNS request for a name on the static database, the security appliance looks inside the DNS packets for the domain name and associated IP address and adds the name and IP address to the DNS reverse lookup cache.

### Related Topics

- [Botnet Traffic Filter Rules Page, page 19-9](#)

## Task Flow for Configuring the Botnet Traffic Filter

To configure the Botnet Traffic Filter, follow these steps:

- 
- Step 1** Enable use of a DNS server.
- This procedure enables security appliance use of a DNS server. In multiple context mode, enable DNS per context.
- For more information, see [DNS Page, page 51-13](#)
- Step 2** Enable use of the dynamic database.
- This procedure enables database updates from the Cisco update server, and also enables use of the downloaded dynamic database by the security appliance. Disallowing use of the downloaded database is useful in multiple context mode so you can configure use of the database on a per-context basis.
- For more information, see [Configuring the Dynamic Database, page 19-4](#)
- Step 3** (Optional) Add static entries to the database.
- This procedure lets you augment the dynamic database with domain names or IP addresses that you want to blacklist or whitelist. You might want to use the static database instead of the dynamic database if you do not want to download the dynamic database over the Internet.
- For more information, see [Adding Entries to the Static Database, page 19-5](#)
- Step 4** Enable DNS snooping.
- This procedure enables inspection of DNS packets, compares the domain name with those in the dynamic database or the static database (when a DNS server for the security appliance is unavailable), and adds the name and IP address to the DNS reverse lookup cache. This cache is then used by the Botnet Traffic Filter logging function when connections are made to the suspicious address.
- For more information, see [Enabling DNS Snooping, page 19-6](#)
- Step 5** Enable traffic classification and actions for the Botnet Traffic Filter.
- This procedure enables the Botnet Traffic Filter, which compares the source and destination IP address in each initial connection packet to the IP addresses in the dynamic database, static database, DNS reverse lookup cache, and DNS host cache, and sends a syslog message for any matching traffic or drops that traffic.
- For more information, see [Enabling Traffic Classification and Actions for the Botnet Traffic Filter, page 19-6](#)
- Step 6** Monitor and Mitigate Botnet Activity.
- After configuring the Botnet Traffic Filter on a device, the device will begin generating syslog messages to notify you of botnet activity. You should verify the syslog configuration on the device so that messages are appropriately logged and that notifications are sent as needed. As malicious traffic is identified, you will need to perform necessary actions to stop such traffic and to clean any infected computers that are generating the malicious traffic.
- For more information, see the following references:
1. [Chapter 52, “Configuring Logging Policies on Firewall Devices”](#)
  2. [Monitoring and Mitigating Botnet Activity, page 66-52](#)
  3. [Understanding Firewall Summary Botnet Reports, page 67-14](#)
-

## Configuring the Dynamic Database

This procedure enables database updates, and also enables use of the downloaded dynamic database by the security appliance.

In multiple context mode, you enable downloading of the dynamic database on the System context so that it is available to all security contexts. You can then decide, on a per-context basis, whether to enable use of the dynamic database or not.

By default, downloading and using the dynamic database is disabled.

### Related Topics

- [Enabling DNS Snooping, page 19-6](#)
- [Enabling Traffic Classification and Actions for the Botnet Traffic Filter, page 19-6](#)
- [Botnet Traffic Filter Rules Page, page 19-9](#)

### Before You Begin

Enable security appliance use of a DNS server (see [DNS Page, page 51-13](#)). In multiple context mode, enable DNS per context.

- 
- Step 1** Do one of the following:
- (Device view) Select **Firewall > Botnet Traffic Filter Rules** from the Policy selector.
  - (Policy view) Select **Firewall > Botnet Traffic Filter Rules** from the Policy Type selector. Select an existing policy or create a new one.

---

**Note** For devices in multiple context mode, you enable downloading of the dynamic database on the System context and enable use of the dynamic database on each security context, as needed.

---

This opens the [Botnet Traffic Filter Rules Page, page 19-9](#).

- Step 2** On the Dynamic Blacklist Configuration tab, select **Enable Dynamic Blacklist From Server** to enable downloading of the dynamic database.

---

**Note** In multiple context mode, you enable downloading of the dynamic database on the System context.

---

This setting enables downloading of the dynamic database from the Cisco update server. If you do not have a database already installed on the security appliance, it downloads the database after approximately 2 minutes. The update server determines how often the security appliance polls the server for future updates, typically every hour.

- Step 3** (Multiple context mode only) Click **Save** to save the changes to the System context. Then change to the context where you want to configure the Botnet Traffic Filter, select **Firewall > Botnet Traffic Filter Rules** for that context, and then proceed to [Step 4](#).

- Step 4** On the Dynamic Blacklist Configuration tab, select **Use Dynamic Blacklist** to enable use of the dynamic database.

**Note** In multiple context mode, these settings are disabled on the System context.

## Adding Entries to the Static Database

The static database lets you augment the dynamic database with domain names, IP addresses, or network addresses that you want to blacklist or whitelist. For more information, see [Understanding Botnet Traffic Filtering, page 19-1](#).

### Related Topics

- [Whitelist/Blacklist Tab, page 19-14](#)
- [Device Whitelist or Device Blacklist Dialog Box, page 19-15](#)
- [Understanding Botnet Traffic Filtering, page 19-1](#)

- [Enabling DNS Snooping, page 19-6](#)
- [Enabling Traffic Classification and Actions for the Botnet Traffic Filter, page 19-6](#)
- [Botnet Traffic Filter Rules Page, page 19-9](#)

### Before You Begin

- Enable security appliance use of a DNS server (see [DNS Page, page 51-13](#)). In multiple context mode, enable DNS per context.

- Step 1** Do one of the following:
- (Device view) Select **Firewall > Botnet Traffic Filter Rules** from the Policy selector.
  - (Policy view) Select **Firewall > Botnet Traffic Filter Rules** from the Policy Type selector. Select an existing policy or create a new one.

**Note** For devices in multiple context mode, you configure the static database on the security context.

This opens the [Botnet Traffic Filter Rules Page, page 19-9](#).

- Step 2** On the Whitelist / Blacklist tab, click the **Add Rows** button that corresponds with the type of entry you are adding (Whitelist or Blacklist).

This opens the [Device Whitelist or Device Blacklist Dialog Box, page 19-15](#).

- Step 3** In the Domain or IP Address field, enter one or more domain names, IP addresses, and IP address/netmasks. Enter multiple entries separated by commas or on separate lines. You can enter up to 1000 entries for each type.

**Step 4** Click **OK**.

---

## Enabling DNS Snooping

This procedure enables inspection of DNS packets and enables Botnet Traffic Filter snooping, which compares the domain name with those on the dynamic database or static database, and adds the name and IP address to the Botnet Traffic Filter DNS reverse lookup cache. This cache is then used by the Botnet Traffic Filter logging function when connections are made to the suspicious address.

The default configuration for DNS inspection inspects all UDP DNS traffic on all interfaces, and does not have Botnet Traffic Filter snooping enabled. We suggest that you enable Botnet Traffic Filter snooping only on interfaces where external DNS requests are going. Enabling Botnet Traffic Filter snooping on all UDP DNS traffic, including that going to an internal DNS server, creates unnecessary load on the security appliance.

**Note** TCP DNS traffic is not supported.

---

- 
- Step 1** You must first configure DNS inspection for traffic that you want to snoop using the Botnet Traffic Filter. See [Chapter 17, “Managing Firewall Inspection Rules”](#).
- Step 2** While defining a new inspection rule or editing an existing inspection rule, select DNS as the protocol you want to inspect.
- The Configure button to the right of the Selected Protocol field becomes active.
- Step 3** Click **Configure**.
- This opens the [Configure DNS Dialog Box, page 17-18](#).
- Step 4** To enable DNS snooping, select **Enable Dynamic Filter Snooping**.
- Step 5** Click **OK**.
- 

## Enabling Traffic Classification and Actions for the Botnet Traffic Filter

This procedure enables the Botnet Traffic Filter, which compares the source and destination IP address in each initial connection packet to the IP addresses in the dynamic database, static database, DNS reverse lookup cache, and DNS host cache, and sends a syslog message for any matching traffic. The

Botnet Traffic Filter can also drop the connection when matching traffic is encountered. For a particular interface, you can specify only one enable rule that identifies the traffic that is subject to Botnet Traffic Filtering; however, you can specify multiple drop rules to identify traffic that should be dropped by the Botnet Traffic Filter.

The DNS snooping is enabled separately (see [Enabling DNS Snooping, page 19-6](#)). Typically, for maximum use of the Botnet Traffic Filter, you need to enable DNS snooping, but you can use Botnet Traffic Filter logging independently if desired. Without DNS snooping for the dynamic database, the Botnet Traffic Filter uses only the static database entries, plus any IP addresses in the dynamic database; domain names in the dynamic database are not used.

### What You Need To Know About Botnet Traffic Classification ACLs

When you configure the enable and drop rules, you have the option of specifying an extended ACL policy object to limit the traffic to which Botnet Traffic Filtering will be applied. If you do not specify an ACL object, filtering is done for all traffic: this is equivalent to specifying an ACL with the single rule permit IP any any.

If you want to specify an ACL so that filtering is performed on less than all traffic, keep the following in mind:

- Permit rules identify the traffic that is subject to Botnet Traffic Filtering. In drop rules, permit entries identify the traffic that the ASA is allowed to drop.
- Deny rules identify the traffic that should not be subject to filtering. The Botnet Traffic Filter ignores traffic that matches deny entries.
- The ACL that you select for drop rules should be a subset of the ACL used in the enable rules for the interface. For traffic to be dropped, there must not only be a permit rule in the drop rule's ACL, the traffic must also fall under a permit rule in the enable rule's ACL. This is because the drop rule is not considered until traffic permitted in an enable rule has first been identified as blacklisted.

We recommend enabling the Botnet Traffic Filter on all traffic on the Internet-facing interface, and enabling dropping of traffic with a severity of moderate and higher.

### Related Topics

- [Traffic Classification Tab, page 19-11](#)
- [BTF Enable Rules Editor, page 19-12](#)
- [BTF Drop Rules Editor, page 19-13](#)
- [Understanding Botnet Traffic Filtering, page 19-1](#)
- [Task Flow for Configuring the Botnet Traffic Filter, page 19-2](#)
- [Configuring the Dynamic Database, page 19-4](#)
- [Adding Entries to the Static Database, page 19-5](#)
- [Enabling DNS Snooping, page 19-6](#)
- [Botnet Traffic Filter Rules Page, page 19-9](#)

---

#### Step 1 Do one of the following:

- (Device view) Select **Firewall > Botnet Traffic Filter Rules** from the Policy selector.
- (Policy view) Select **Firewall > Botnet Traffic Filter Rules** from the Policy Type selector. Select an existing policy or create a new one.

---

**Note** For devices in multiple context mode, you configure traffic classification on the security context.

---

This opens the [Botnet Traffic Filter Rules Page, page 19-9](#).

**Step 2** To enable the Botnet Traffic Filter on specified traffic, follow these steps:

- a. On the Traffic Classification tab, click **Add Row** under the Enable Rules table.

This opens the [BTF Enable Rules Editor, page 19-12](#).

- b. In the Interfaces field, specify the interface or interfaces on which you want to enable the Botnet Traffic Filter. Normally, you want to enable the Internet-facing interface only. To select the interfaces or interface role objects using the Interfaces Selector, click **Select** (see [Understanding Interface Role Objects, page 6-67](#)).

You can configure a global classification that applies to all interfaces by selecting the All Interfaces role object (selected by default). If you configure an interface-specific classification, the settings for that interface overrides the global setting.

- c. Do one of the following to identify the traffic that you want to monitor:
- To monitor all traffic, leave the ACL field blank.
  - To specify the traffic that you want to monitor, click **Select** to the right of the ACL field to select an Access Control List object that identifies the traffic that you want to monitor. For example, you might want to monitor all port 80 traffic on the outside interface. For more information about Access Control List objects, see [Creating Access Control List Objects, page 6-49](#).

---

**Note** You can specify only one enable rule per interface.

---

- d. Click **OK**.

The BTF Enable Rules Editor closes and the rule is added to the Enable Rules table.

**Step 3** To automatically drop malware traffic, follow these steps:

---

**Note** You must enable the Botnet Traffic Filter for the traffic you want to automatically drop before creating a drop rule for that traffic.

---

- a. On the Traffic Classification tab, click **Add Row** under the Drop Rules table.

This opens the [BTF Drop Rules Editor, page 19-13](#).

- b. In the Interfaces field, specify the interface or interfaces on which you want to drop traffic. There must be a corresponding enable rule for the interface. To select the interfaces or interface role objects using the Interfaces Selector, click **Select** (see [Understanding Interface Role Objects, page 6-67](#)).

You can configure a global classification that applies to all interfaces by selecting the All Interfaces role object (selected by default). If you configure an interface-specific classification, the settings for that interface overrides the global setting.

- c. Do one of the following to identify the traffic that you want to drop:
- To monitor all traffic, leave the ACL field blank.

- To specify the traffic that you want to monitor, click **Select** to the right of the ACL field to select an Access Control List object that identifies the traffic that you want to monitor. For example, you might want to monitor all port 80 traffic on the outside interface. For more information about Access Control List objects, see [Creating Access Control List Objects, page 6-49](#).
- d. In the Threat Level area, choose one of the following options to drop traffic specific threat levels. The default level is a range between Moderate and Very High.

**Note** We highly recommend using the default setting unless you have strong reasons for changing the setting.

- Value—Specify the threat level you want to drop.
- Range—Specify a range of threat levels.

**Note** Static blacklist entries are always designated with a Very High threat level.

- e. Click **OK**.

The BTF Drop Rules Editor closes and the rule is added to the Drop Rules table.

**Step 4** To add more rules, repeat steps 2 and 3, as required. When finished adding rules, click **Save** to save your changes.

**Step 5** To treat graylisted traffic as blacklisted traffic for action purposes, on the Dynamic Blacklist Configuration tab, check the **Treat Ambiguous traffic as Blacklist** check box.

If you do not enable this option, graylisted traffic will not be dropped if you configure a drop rule for that traffic.

## Botnet Traffic Filter Rules Page

You can use the Botnet Traffic Filter Rules page to define rules for identifying malicious traffic passing through your ASA security device.

The Botnet Traffic Filter Rules page is divided into three sections:

- [Dynamic Blacklist Configuration Tab, page 19-10](#)
- [Traffic Classification Tab, page 19-11](#)
- [Whitelist/Blacklist Tab, page 19-14](#)

### Navigation Path

To access the Botnet Traffic Filter Rules page, do one of the following:

- (Device view) Select a device, then select **Firewall > Botnet Traffic Filter Rules** from the Policy selector.
- (Policy view) Select **Firewall > Botnet Traffic Filter Rules** from the Policy Type selector. Select an existing policy or create a new one.
- (Map view) Right-click a device and select **Edit Firewall Policies > Botnet Traffic Filter Rules**.

**Table 19-1**      *Dynamic Blacklist Configuration Tab*

| Element                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Dynamic Blacklist From Server | <p>Enables downloading of the dynamic database from the Cisco update server. If you do not have a database already installed on the security appliance, it downloads the database after approximately 2 minutes. The update server determines how often the security appliance polls the server for future updates, typically every hour.</p> <p><b>Note</b> If the device is in multiple context mode, configure this option on the System context for that device.</p> |

**Table 19-1** *Dynamic Blacklist Configuration Tab (Continued)*

| Element                              | Description                                                                                                                                                                                                                  |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Use Dynamic Blacklist                | Enables use of the dynamic database for the Botnet Traffic Filter.<br><b>Note</b> In multiple context mode, you configure use of the database on a per-context basis.                                                        |
| Treat Ambiguous traffic as Blacklist | When selected, graylisted traffic will be treated as blacklisted traffic for action purposes.<br><br>If you do not enable this option, graylisted traffic will not be dropped if you configure a drop rule for that traffic. |

## Traffic Classification Tab

Use the Traffic Classification tab to view or to configure the traffic classification definitions for a device or shared policy and to identify malicious traffic that you want automatically dropped. Traffic classification definitions (enable rules) consist of an interface or interface role with an associated ACL that identifies the traffic that is monitored by the Botnet Traffic Filter. You can configure settings for specific interfaces or for interface roles. You can use the All Interfaces role object to enable botnet filtering globally (selected by default). If you configure an interface-specific classification, the settings for that interface override any settings defined for an interface role.

For a particular interface, you can specify only one enable rule that identifies the traffic that is subject to Botnet Traffic Filtering; however, you can specify multiple drop rules to identify traffic that should be dropped by the Botnet Traffic Filter.

### Note

We highly recommend configuring Dynamic Filter Snooping for proper functioning of the Botnet Traffic Filter. When in Device view, Cisco Security Manager provides a link at the bottom of the Traffic Classification tab that will take you directly to the Inspection Rules page so that you can enable Dynamic Filter Snooping. For more information, see [Enabling DNS Snooping, page 19-6](#).

The columns in the tables summarize the settings for an entry and are explained in [BTF Enable Rules Editor, page 19-12](#) and [BTF Drop Rules Editor, page 19-13](#).

To configure traffic classification and actions:

- Click the **Add Row** button to add an interface or interface role to the table, and fill in the [BTF Enable Rules Editor, page 19-12](#) or [BTF Drop Rules Editor, page 19-13](#).
- Select an entry and click the **Edit Row** button to edit an existing entry.
- Select an entry and click the **Delete Row** button to delete it.

### Navigation Path

From the [Botnet Traffic Filter Rules Page, page 19-9](#), click the **Traffic Classification** tab.

## BTF Enable Rules Editor

Use the BTF Enable Rules Editor to specify the interfaces on which you want to enable the Botnet Traffic Filter and to identify the traffic that you want to monitor. You can specify only one enable rule per interface.

### Navigation Path

To access the BTF Enable Rules Editor, right-click inside the work area of the Enable Rules table on the Traffic Classification tab and then select **Add Row**, or right-click an existing entry and select **Edit Row**.

| Interfaces | <p>The interfaces or interface roles on which you want to enable the Botnet Traffic Filter. Enter the name of the interface or the interface role, or click <b>Select</b> to select the interface or role from a list, or to create a new role. An interface must already be defined to appear on the list.</p> <p>You can use the All Interfaces role object to enable botnet filtering globally (selected by default). If you configure an interface-specific classification, the settings for that interface override the global settings.</p> <p>Interface role objects are replaced with the actual interface names when the configuration is generated for each device. See <a href="#">Understanding Interface Role Objects, page 6-67</a>.</p> |

**Table 19-2** BTF Enable Rules Editor (Continued)

| Element | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ACL     | <p>Specifies the access-list to use for identifying the traffic that you want to monitor. If you do not specify an access list, by default you monitor all traffic.</p> <p>To specify the traffic that you want to monitor, click <b>Select</b> to the right of the ACL field to select an Access Control List object that identifies the traffic that you want to monitor. For example, you might want to monitor all port 80 traffic on the outside interface. For more information about Access Control List objects, see <a href="#">Creating Access Control List Objects, page 6-49</a>.</p> |

## BTF Drop Rules Editor

Use the BTF Drop Rules Editor to identify malware traffic that you want to automatically drop. You can specify multiple drop rules per interface.

### Navigation Path

To access the BTF Drop Rules Editor, right-click inside the work area of the Drop Rules table on the Traffic Classification tab and then select **Add Row**, or right-click an existing entry and select **Edit Row**.

| Threat Level | <p>The Threat Level fields identify the threat level of malicious traffic that you want dropped. The default level is a range between Moderate and Very High.</p> <p><b>Note</b> We highly recommend using the default setting unless you have strong reasons for changing the setting.</p> <ul style="list-style-type: none"> <li>• Value—Specify the threat level you want to drop. <ul style="list-style-type: none"> <li>– Very-low</li> <li>– Low</li> <li>– Moderate</li> <li>– High</li> <li>– Very-high</li> </ul> </li> <li>• Range—Specify a range of threat levels.</li> </ul> <p><b>Note</b> Static blacklist entries are always designated with a Very High threat level.</p>                                                             |

## Whitelist/Blacklist Tab

Use the Whitelist/Blacklist tab to view or to configure the static database entries for a device or shared policy. The Device Blacklist contains domain names or IP addresses of malicious or undesirable sites. You can use the static blacklist to supplement the Cisco dynamic database or you can use the static blacklist alone if you can identify all the malware sites that you want to target.

The Device Whitelist contains domain names or IP addresses of sites that are deemed to be acceptable. If the dynamic database includes blacklisted addresses that you think should not be blacklisted, you can manually enter them into a static whitelist. Static whitelist entries take precedence over entries in the static blacklist and the Cisco dynamic database. Whitelisted addresses still generate syslog messages, but because you are only targeting blacklist syslog messages, they are informational.

To configure the static database:

- Click the **Add Row** button to define static database entries using the [Device Whitelist or Device Blacklist Dialog Box, page 19-15](#).
- Select an entry and click the **Edit Row** button to edit an existing entry.

**Timesaver**

---

Select an entry and press **F2** or double-click on an entry in the Device Whitelist or Device Blacklist to edit that entry in place.

---

- Select an entry and click the **Delete Row** button to delete it.

**Navigation Path**

From the [Botnet Traffic Filter Rules Page, page 19-9](#), click the **Whitelist/Blacklist** tab.

**Related Topics**

- [Dynamic Blacklist Configuration Tab, page 19-10](#)
- [Traffic Classification Tab, page 19-11](#)

## Device Whitelist or Device Blacklist Dialog Box

Use the Device Whitelist or Device Blacklist dialog box to manually define domain names or IP addresses that you want to add to the whitelisted (safe) or blacklisted (malicious) lists. You can use the static blacklist to supplement the Cisco dynamic database or you can use the static blacklist alone if you can identify all the malware sites that you want to target. Names or addresses that appear on both the whitelist and the dynamic blacklist are identified only as whitelist addresses in syslog messages and reports.

Domain names can be complete (including the host name, such as [www.cisco.com](#)), or partial (such as [cisco.com](#)). For partial names, all web site hosts on that domain are either whitelisted or blacklisted. You can also enter host IP addresses. Use a comma or new line to separate multiple entries.

**Navigation Path**

From the [Whitelist/Blacklist Tab, page 19-14](#), click the **Add Rows** button beneath the Device Whitelist or Device Blacklist tables, or select an entry and click the **Edit Row** button.

## CHAPTER 20

# Working with ScanSafe Web Security

Security Manager provides integration with ScanSafe Web Security. ScanSafe Web Security is a cloud-based SaaS (Security as a Service) function that makes available its web security data centers at various locations worldwide. When ScanSafe Web Security is integrated with a router, selected HTTP and HTTPS traffic is redirected to ScanSafe Cloud for content scanning and for malware detection by other means. Also, you can use ScanSafe Web Security to provide differentiated services to particular users, user groups, and IPs.

Invoking ScanSafe Web Security from Security Manager, you can define policies and settings in the following areas:

- Content scanning settings
- Content scanning policies
- AAA server settings
- AAA policies

With ScanSafe Web Security integration in Security Manager you can copy and share most policies and framework-based policy features. The following table details the scope of support for scanning and AAA policy types.

| Supported Type        | Example                                                                                                                                                                                                                                                                                                    |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content Scan Settings | Primary server IP, secondary server IP, server timeouts                                                                                                                                                                                                                                                    |
| Content Scan Policies | Global whitelist policies<br>Include/exclude user groups, default user configuration, default user group configuration<br>Interfaces that must have content scanning enabled                                                                                                                               |
| AAA Server Settings   | Identity policy object used in http-basic and NTLM policy<br>Http-basic and NTLM related timeouts<br>Order of occurrence for proxy, http-basic, and NTLM<br>LDAP server and LDAP attribute map configuration for IOS<br><b>Note</b> Radius and TACAS servers are also supported.<br>Per interface AAA list |
| AAA Policies          | Http-basic and NTLM admission rule support (authentication methods) now join the previously available Auth-Proxy method                                                                                                                                                                                    |

Security Manager does *not* support the following features:

- PAM configuration when inspect or ZBF rules for http/https are not present
- Auth-proxy using LDAP on older IOS versions. (That is, only IOS versions that support ScanSafe Web Security)
- Identity policy with auth-proxy as AAA method. (Support only for NTLM and http-basic.)
- Validation of Virtual Template number for identity policy creation
- Validation of the Secure Trust Point for LDAP server
- Inheritance of content scanning rules
- AD browsing of user groups and users
- Tool support for newer policies (such as policy query)
- Control tag policy

For more information on the ScanSafe Web Security product, go to <http://www.cisco.com/en/US/partner/products/ps11720/index.html>.

## Configuring ScanSafe Web Security

Use the ScanSafe Web Security Settings page to define the settings for the default user group. As with other settings policies, you can share the default user group policy settings.

---

**Note**

All steps are shown as performed from the Policy view.

---

To configure ScanSafe Web Security, perform the following steps:

- 
- Step 1** From the Policy Types selector, select Firewall > ScanSafe Web Security.  
The ScanSafe Web Security page appears with the Interfaces tab selected.
- Step 2** Enable those interfaces by which web requests are to be forwarded to the ScanSafe Web Security server by selecting them from the list in the **Available Interfaces** column and moving them to the **Selected Interfaces** column.
- Step 3** Select the **WhiteListing Regular Expressions** tab.
- Step 4** Select the **Notify Tower** checkbox to send notifications to the ScanSafe Web Security server regarding the whitelisting. It is applicable to all whitelisting except that which is IP-based.  
(ScanSafe Web Security receives a warning when no regular expression is specified for white listing.)
- Step 5** In the HTTP Host area specify the regular expressions to be whitelisted (using regular expression matching) by selecting them from the list in the **Available Regular Expressions** column and moving them to the **Selected Regular Expressions** column.
- Step 6** In the HTTP User Agent area specify the regular expressions to be whitelisted by selecting them from the list in the **Available Regular Expressions** column and moving them to the **Selected Regular Expressions** column.
- Step 7** Select the **WhiteListing ACLs** tab.
- Step 8** Specify the type of ACLs to operate upon by selecting either **Extended** or **Standard** from the Type list.
- Step 9** Specify the ACLs to whitelist by selecting them from the list in the column on the left and moving them to the **Selected items** column.
- Step 10** Select the **User Groups** tab.
-  **Tip** You can use the User Groups page to define user groups, specify both the default user and default user group, and to include or exclude user groups. You can also edit or delete entries in all three of these lists.
- 
- Step 11** Specify a default user by entering the user name in the **Default User** field (optional).
- Step 12** Specify a default user group by entering the user group name in the **Default User Group** field.
- Step 13** Include a user group by selecting the interface and then adding the user group to the Include list.
- Step 14** Exclude a user group by selecting the interface and then adding the user group to the Exclude list.
- Step 15** Select **Policy > Firewall > Settings > ScanSafe Web Security** from the policy selector.
- Step 16** With the **Details** tab selected, specify the Primary ScanSafe Server by entering the following values:
- IP Address/Name
  - HTTP Port (default 8080)
  - HTTPS Port (default 8080)
- Step 17** With the **Details** tab selected, specify the Secondary ScanSafe Server by entering the following values:
- IP Address/Name (only a valid IP address or FQDN).
  - HTTP Port (default 8080)
  - HTTPS Port (default 8080)
- Step 18** Specify the **Server Timeout** period in seconds (default 300).

**Step 19** Specify the **Session Idle Timeout** period in seconds (default 300).

**Step 20** Specify the source address by doing *one* of the following:

- Click the **IP Address** button and then enter the IP address.
- Click the **Interface** button, and then click the **Select** button and browse the Interface Selector to select an interface.

**Note** A valid source IP or interface must be one of the interfaces on which ScanSafe Web Security is enabled (on the Firewall > ScanSafe Web Security page > Interface tab).

**Step 21** Enter the **License** and select the checkbox if it is encrypted.

**Tip** If Encrypted is not selected, the value entered must be 32 hexadecimal characters.

**Step 22** If desired, select the **Enable Logging** checkbox.

## ScanSafe Web Security Page

Security Manager provides integration with ScanSafe Web Security. ScanSafe Web Security is a cloud-based SaaS (Security as a Service) function that makes available its web security data centers at various locations worldwide. When ScanSafe Web Security is integrated with a router, selected HTTP and HTTPS traffic is redirected to ScanSafe Cloud for content scanning and for malware detection by other means. Also, you can use ScanSafe Web Security to provide differentiated services to particular users, user groups, and IPs.

Using ScanSafe Web Security in Security Manager, you can define settings and policies in the following areas:

- Content scanning settings
- Content scanning policies
- AAA server settings
- AAA policies

With ScanSafe Web Security integration in Security Manager you can copy and share most policies and framework-based policy features.

For information on how best to configure the ScanSafe Web Security Page for your particular purposes, see [Working with ScanSafe Web Security](#).

### Navigation Path

(Policy view) Select Firewall and open Settings from the Policy Type selector. Then click ScanSafe Web Security to open the ScanSafe Web Security Settings Page.

**Note** Configuration of the ScanSafe Web Security policies and settings is also possible by way of the Map view.

| —Filter                                          | Details on using filters in Security Manager are found at <a href="#">Filtering Tables, page 1-45</a> .                                                                                                                                                                                                  |
| Interfaces                                       | This tab allows you to select interfaces and Security Manager-defined interface roles on which web requests will be forwarded to the ScanSafe Web Security server for content scanning.                                                                                                                  |
| —Available Interfaces                            | Interfaces that are available to be selected for ScanSafe Web Security.                                                                                                                                                                                                                                  |
| —Selected Interfaces                             | Interfaces selected must be facing the WAN on which hosts' requests for web services are forwarded to ScanSafe Web Security server                                                                                                                                                                       |
| -                                                | -                                                                                                                                                                                                                                                                                                        |
| <b>Whitelisting Regular Expressions Tab</b>      |                                                                                                                                                                                                                                                                                                          |
| —Notify Tower                                    | This checkbox, when selected, specifies that the ScanSafe Web Security tower must be notified regarding the whitelisting. It is applicable to all ACL-based whitelisting variants except IP based whitelisting. The default behavior is that the notification is not sent.                               |
| —Available Regular Expressions (HTTP Host)       | Lists the regular expressions available and considered for delivery to the ScanSafe Web Security server.                                                                                                                                                                                                 |
| —Filter (HTTP Host)                              | Enables the administrator to filter whitelisted regular expressions sent to ScanSafe Web Security server by specifying include and exclude user group list. It operates on a match-all or match-any basis.                                                                                               |
| —Selected Regular Expressions (HTTP Host)        | A host that matches the selected regular expressions is whitelisted, and is not redirected to the ScanSafe Web Security server.                                                                                                                                                                          |
| —Available Regular Expressions (HTTP User Agent) | An agent that matches the available regular expressions is whitelisted, and is not redirected to the ScanSafe Web Security server.                                                                                                                                                                       |
| —Selected Regular Expressions (HTTP User Agent)  | When configured, only regular expressions that are in the Selected Regular Expressions list are sent to ScanSafe Cloud.                                                                                                                                                                                  |
| <b>Whitelisting ACLs Tab</b>                     |                                                                                                                                                                                                                                                                                                          |
| —ACL Type                                        | Specifies the type of ACL Whitelisting, either standard or extended.<br><br><b>Note</b> Standard ACLs used for whitelisting are discovered as extended ACLs. A prefix of "CSM_EXT_" is added to the ACL name. Standard ACLs are converted to extended ACLs as extended ACLs are complete and recommended |

| Element                                 | Description                                                                                                                                                                                                                      |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| —Selected ACLS                          | When configured, only regular expressions that are in the Selected Regular Expressions list are sent to ScanSafe Cloud.                                                                                                          |
| <b>User Groups Tab</b>                  |                                                                                                                                                                                                                                  |
| —Default User                           | A global name that is sent to the ScanSafe Web Security server when there is no content-scan-session specific user name. Use it when you want the same content scan policy for all users in a branch office (for example).       |
| —Default User Group                     | A global name that is sent to the ScanSafe Web Security server when there is no content-scan-session specific user name. Use it when you want the same content scan policy for all user groups in a branch office (for example). |
| —Interface Specific Default User Groups | Lists default user group for each interface.                                                                                                                                                                                     |
| —Include/Exclude                        | You can use the Include and Exclude lists to specify the particular user groups to be included or excluded.                                                                                                                      |

## Add and Edit Default User Groups Dialog Box

Use the Default User Groups dialog box to specify the default user group for a particular interface.

This dialog box is only useful when the ISR cannot determine user credentials, but would like to assign the users (that is, the IP addresses) to a user group so that other group-based policies in the ISR can be enforced. Only one group can be configured on an interface.

For details on these ScanSafe Web Security server configuration settings, see the [ScanSafe Web Security Settings Page](#).

**Table 20-1** ScanSafe Web Security Settings

| Element                                      | Description                                                                                                                                                 | Usage    |
|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| IP Address/Name<br>(Primary ScanSafe Server) | The primary FQDN or IP address of the server configured to operate ScanSafe Web Security.                                                                   | Both     |
| HTTP Port<br>(Primary ScanSafe Server)       | Default primary port for proxied HTTP traffic (default=8080).                                                                                               | Both     |
| HTTPS Port<br>(Primary ScanSafe Server)      | Default primary port for proxied HTTPS traffic (default=8080).                                                                                              | Both     |
| IP Address/Name<br>(Backup ScanSafe Server)  | The secondary FQDN or IP address of the server configured to operate ScanSafe Web Security.                                                                 | Both     |
| HTTP Port<br>(Backup ScanSafe Server)        | Default secondary port for proxied HTTP traffic (default=8080).                                                                                             | Both     |
| HTTPS Port<br>(Secondary ScanSafe Server)    | Default secondary port for proxied HTTPS traffic (default=8080).                                                                                            | Both     |
| Server Timeout                               | Polling timeout when checking the availability of the ScanSafe Web Security server.                                                                         | IOS Only |
| Session Idle Timeout                         | Inactivity timeout of the ScanSafe Web Security server (default=300 seconds). Used to remove the session if it is found inactive.                           | IOS Only |
| On Failure                                   | Determines the action to be taken (Drop all Traffic or Allow All Traffic) when both primary and secondary ScanSafe Web Security servers are found inactive. | IOS Only |
| IP Address (Source Address)                  | IP address from which a packet to the ScanSafe Web Security server originates from the router.                                                              | IOS Only |
| Interface (Source Address)                   | Interface address from which a packet to the ScanSafe Web Security server originates from the router.                                                       | IOS Only |
| License                                      | The license sent to the ScanSafe Web Security server (32 hexadecimal characters).                                                                           | Both     |
| Encrypted                                    | When selected, enables the encryption. ASA does not accept encrypted license text to be configured.                                                         | IOS Only |
| Enable Logging Checkbox                      | Enables IOS syslogs (default=not enabled).                                                                                                                  | IOS Only |
| Public Key File                              | Name of the public key file                                                                                                                                 | ASA Only |
| Connection Retry Count                       | Number of times that the system should retry connecting.                                                                                                    | ASA Only |

# CHAPTER 21

## Managing Zone-based Firewall Rules

---

The Zone-based Firewall feature (also known as Zone-based Policy Firewall) allows unidirectional application of IOS firewall policies between groups of interfaces known as “zones.” That is, interfaces are assigned to zones, and firewall rules are applied to specific types of traffic moving in one direction between the zones. Zone-based firewalls enforce a secure inter-zone policy by default, meaning traffic cannot pass between security zones until an explicit policy allowing that traffic is defined.

The “zone” itself is an abstraction—multiple interfaces with the same or similar security requirements that can be logically grouped together. For example, router interfaces Ethernet 0/0 and Ethernet 0/1 might be connected to the local LAN. When viewed from a firewall perspective, these two interfaces are similar in that they represent the internal network, and they can be grouped into a single zone for the purposes of firewall configuration. Then you can specify firewall policies between that and other zones. These inter-zone policies offer considerable flexibility and granularity, so different inspection policies can be applied to multiple host groups connected to the same router interface.

### Note

---

The zone-based firewall feature is supported on IOS devices running 12.4(6)T or later, and ASR devices running 12.2(33) or later.

---

### A Simple Example

A security zone should be configured for each region of similar security within the network, so that all interfaces assigned to the same zone are protected with a similar level of security. For example, consider an access router with three interfaces:

- One interface is connected to the public Internet
- One interface is connected to a private LAN that must not be accessible from the public Internet
- One interface is connected to an Internet-service “demilitarized zone” (DMZ), where a Web server, Domain Name System (DNS) server, and e-mail server must have access to the public Internet

Each interface in this network would be assigned to its own zone, as shown in the following figure.

**Figure 21-1 Basic Security Zone Topology**

This example configuration typically would have three main policies (sets of rules) defining:

- Private zone connectivity to the Internet
- Private zone connectivity to DMZ hosts
- Internet zone connectivity to DMZ hosts

Zone-based firewalls impose a prohibitive default security posture. In other words, for example, unless the DMZ hosts are specifically allowed access to other networks, those networks are protected against any undesired connections from the DMZ hosts. Similarly, unless access is specifically provided for Internet hosts to access the Private zone directly, the Private zone hosts are safe from unwanted access by Internet hosts.

In this simple example, each zone has only one member interface. If an additional interface is added to the Private zone, for example, the hosts connected to that new interface can immediately pass traffic to all hosts connected to the existing interface in the zone. Additionally, traffic to hosts in other zones is immediately controlled by existing Private zone policies.

In a more realistic example, you might allow varied access from the public Internet to specific hosts in the DMZ, and varied application-use policies for hosts in the protected LAN.

## Understanding the Zone-based Firewall Rules

Zones establish the security borders of your network. A zone defines a boundary where traffic is subjected to inspection or filtering as it crosses to another region of your network. The default zone-based firewall policy between zones is “deny all.” Thus, if no zone-based firewall rules are explicitly configured, all traffic moving between all zones is blocked.

Zone-based firewall rules apply specific actions—Drop, Pass, Inspect, and Content Filter—to various types of unidirectional traffic between pairs of zones. The direction of the traffic is determined by specifying a source and destination zone as part of each rule.

### Logging

Zone-based firewall rules offer syslog, alert, and audit-trail logging options. Most messages are logged to the router console unless a syslog server is configured. See [Logging on Cisco IOS Routers, page 62-1](#) for information about configuring syslog logging.

### Important Points

Please note the following points regarding zones and zone-based firewall rules:

- Zone-based firewall rules are supported only for IOS versions 12.4(6)T or later.
- If a zone-based firewall rule and an IOS Inspection rule use the same interface, an error results.  
The zone-based firewall model and the earlier interface-based inspection rules model are not mutually exclusive on the router, but they cannot be combined on any given interface. That is, an interface cannot be configured as a member of a security zone if it is configured with Inspection rules. Further, configuring a router to use both models at the same time is not recommended.
- An interface can be assigned to only one security zone, but zones can include multiple interfaces. If an interface is assigned to more than one zone, an error results.
- All traffic to and from a given interface is implicitly blocked when the interface is assigned to a zone (except traffic to and from other interfaces in the same zone, and traffic to any interface on the router). Thus, to permit traffic to and from a zone-member interface, one or more rules allowing or inspecting traffic must be configured between that zone and any other zone.
- Traffic is implicitly allowed to flow between interfaces that are members of the same zone. However, you can define rules that require inspection of traffic between same-zone members.
- The “Self” zone is a default zone that defines the router itself as a separate security zone, which you can specify as either the source or destination zone. The Self zone is the only exception to the default “deny all” policy. All traffic to any router interface is allowed until explicitly denied.

A zone-based firewall rule that includes the Self zone applies to local traffic—that is, traffic directed to the router, or to traffic generated by the router; it does not apply to traffic through the router. See [The Self Zone, page 21-5](#) for more information.

- The Inspect action is not allowed in rules that apply to the Self zone.
- The Pass action permits traffic in one direction only. You must explicitly define rules for return traffic. However, with the Inspect action, return traffic is automatically allowed for established connections.
- Traffic cannot flow between a zone-member interface and any interface that is not a zone member.

- Interfaces that have not been assigned to a zone can still function as classical router ports and might still have other types of firewall rules configured on them.

However, if an interface is not part of your zone-based firewall policy, it might still be necessary to add that interface to a zone and configure a “pass all” policy (sort of a “dummy policy”) between that zone and any other zone to which inter-zone traffic flow is desired.

- Access-control list (ACL) rules applied on interfaces that are also zone members are processed before the zone rules are applied. Therefore, to continue using both rule types, it may be necessary to relax the interface ACLs to ensure certain traffic flows are processed by the zone-based rules.
- All interfaces in a zone must belong to the same Virtual Routing and Forwarding (VRF) instance. Zone-based rules can be configured between zones whose member interfaces are in separate VRFs. However, if traffic cannot flow between these VRFs, these rules will never be executed. See [Zones and VRF-aware Firewalls, page 21-6](#) for more information.
- Zones are defined using Interface Role objects. If you change the definition of an interface role that you are using for a zone, you are changing the zone, which can affect existing traffic flows. In addition, if you use wildcards in the interface role to specify an interface name pattern, be aware that interfaces may automatically be added to the zone when you create new interfaces on the router.
- If zone-based firewall rules contain conflicting zone information, the first rule defined in the table takes precedence. Rules that do not reference valid zones are not deployed and an activity validation warning is shown.
- Empty zones result in activity validation errors for certain devices; refer to the following restriction lists.
- Source and destination zones cannot be the same for certain devices; refer to the following restriction lists.

### ASR Restrictions

The following are restrictions specific to ASR devices:

- Deep Packet Inspection (DPI) is not allowed.
- Source and destination zones can be the same. This is possible because intra-zone traffic inspection is allowed.
- Content (URL) Filtering is not allowed.
- Only certain protocols are supported, such as DNS, FTP, H.323, ICMP, RTSP, SIP, Skinny, TCP, TFTP, and UDP.

### ISR Restrictions

The following are restrictions specific to ISR devices:

- Empty zones cannot exist.
- Source and destination zones cannot be the same.

## The Self Zone

The router itself is defined as a separate security zone, with the fixed name **Self**, and since IOS firewalls support examination of traffic (TCP, UDP and H.323 only) that terminates or originates on the router (together known as “local” traffic), incoming and outgoing router traffic can be subject to rules in the same way as routed inter-zone traffic.

When an interface is assigned to a zone, the hosts connected to that interface are included in that zone. By default, traffic is allowed to flow between interfaces that are members of the same zone, while a default “deny-all” policy is applied to traffic moving between zones.

However, traffic flowing directly between other zones and the router’s IP interfaces (the Self zone) is implicitly allowed. This ensures that connectivity to the router’s management interfaces is maintained when a zone firewall configuration is applied to the router.

This also means that traffic flowing to and from the IP addresses of the router’s interfaces is not initially controlled by zone policies. If you wish to control traffic moving between the router interfaces and other zones, you must apply rules that block or allow this local traffic.

When configuring the rules for the Self zone, consider the following:

- All IP addresses configured on the router belong to the Self zone, regardless of interface zone membership.
- Traffic to and from the Self zone is unrestricted until you configure explicit rules to the contrary.

That is, when you configure a zone-based firewall rule that includes the Self zone, traffic between the Self zone and the other zone is immediately restricted in both directions. For example, if you define a rule affecting traffic from the “Private” zone to the Self zone, the router cannot originate any traffic to the Private zone until you define one or more rules for Self to Private.

Traffic between the router itself and other zones that are not included in the Self-zone rules remains unaffected.

- The Inspect action is not allowed in rules that apply to the Self zone.

When configuring restrictions on inbound Self-zone traffic, consider the necessary outbound traffic (including the routing and network management protocols). For example, if you restrict inbound traffic from a zone to the router itself, the routing protocols could stop working on all interfaces belonging to that zone.

## Using VPNs with Zone-based Firewall Policies

Recent enhancements to the IP Security (IPsec) VPN implementation simplify firewall policy configuration for VPN connectivity. IPsec Virtual Tunnel Interface (VTI) and GRE+IPsec allow the confinement of VPN site-to-site and client connections to a specific security zone by placing the tunnel

interfaces in that security zone. Connections can be isolated in a VPN DMZ if connectivity must be limited by a specific policy. Or, if VPN connectivity is implicitly trusted, VPN connections can be placed in the same security zone as the trusted inside network.

To configure the router to use zone-based firewall rules with dynamic VPNs (those which dynamically create Tunnel/Loopback/Virtual interfaces):

- Define a zone specifically for the VPN interfaces.
- Enter this zone in the **VPN Zone** field on the VPN tab of the [Zone Based Firewall Page](#), page 21-49.
- Create zone-based firewall rules to allow the VPN traffic, as appropriate.

If non-VTI IPsec is employed, you must exercise caution when you configure a zone-based firewall policy for VPN. The zone policy must specifically allow access to protected hosts by remote VPN hosts or clients if they are in a different zone than the ingress interface for encrypted VPN traffic. This access policy must be configured by including an access control list (ACL) enumerating the source IP addresses of the VPN clients, and the destination IP addresses of all protected hosts the VPN clients are allowed to reach. If the access policy is not properly configured, the policy could expose vulnerable hosts to hostile traffic.

Refer to this white paper on cisco.com “[Using VPN with Zone-Based Policy Firewall](#)” for further discussion of these topics.

## Zones and VRF-aware Firewalls

Cisco IOS firewalls are VRF-aware (Virtual Routing and Forwarding), providing management of IP address overlap across different VRFs, separate thresholds and timeouts for VRFs, and so forth. For application of zone-based firewall rules, all interfaces in a zone must belong to the same VRF.

When multiple VRFs are configured on a router and one interface provides common services to all the VRFs (for example, Internet service), you should place that interface in a separate zone. You can then define policies between the common zone and other zones. (There can be one or more zones per VRF.)

You can configure rules between two zones that contain different VRFs, as shown in the following illustration.

**Figure 21-2** Zones and VRF

In this illustration:

- The interface providing common services is a member of the zone “common.”
- All of VRF A is in a single zone, “vrf\_A.”
- VRF B, which has multiple interfaces, is partitioned into two zones “vrf\_B\_1” and “vrf\_B\_2.”
- Zone Z1 does not have VRF interfaces.

Based on this configuration:

- You can specify policies between each of these zones and the common zone. Additionally, you can specify policies between each of the zones vrf\_A, vrf\_B\_n and Z1 if VRF route export is configured and the traffic patterns make sense.
- You can configure a policy between zones vrf\_A and vrf\_B\_1, but be sure that traffic can flow between them.
- You do not need to specify the global thresholds and timers on a per-VRF basis. Instead, parameters are supplied to the Inspect action through a parameter map.

## Understanding the Relationship Between Permit/Deny and Action in Zone-based Firewall Rules

When you create a zone-based firewall rule, you must specify two execution-related settings: Permit/Deny and an Action (Drop, Pass, Inspect, or Content Filter). To obtain the results you want, you must clearly understand the relationship between these two parameters:

- **Permit/Deny**—The Permit/Deny setting appears to correspond to Permit/Deny in an access control list (ACL) entry. However, in zone-based firewall rules, unlike in standard access rules, these keywords do not permit or deny traffic. Instead, they specify whether you want to apply an Action to the traffic flow defined by the Source, Destination, and Services fields, and they affect processing of related class maps.

- **Permit** – Applies the specified Action to traffic that matches the Source, Destination, and Services fields. (If protocols are listed in the Protocols table, the Action is further limited to those protocols.)

**Tip:** Essentially all of your zone-based rules should be Permit rules. This is the easiest configuration to understand—it means you are identifying the traffic to which you want the chosen Action applied.

- **Deny** – Exempts the traffic defined by the Source, Destination, and Services fields. (If protocols are listed in the Protocols table, the exemption is further limited to those protocols.) In other words, treat the traffic as not matching the rule. Instead, evaluate subsequent class maps (which are not the same as zone rules) for the zone pair and look for a subsequent map that matches the traffic. If no subsequent map matches the traffic, apply the default rule to the traffic (see [Changing the Default Drop Behavior, page 21-47](#)).

It is important to understand that there is not a one-to-one relationship between zone rules and class maps. Therefore, you cannot determine just by looking at the rules table how the rules will be converted to class maps. You must preview the configuration to see which subsequent rules

might be applied to traffic that matches your Deny rule. (To preview the configuration, save your changes and select **Tools > Preview Configuration**. For more information, see [Previewing Configurations, page 8-45](#).)

In general, you might use a Deny rule to exempt a specific IP address within a subnet from a Permit rule you want to apply to the subnet in general; for example, exempting 10.100.10.1 from a rule applying to 10.100.10.0/24. However, it is much easier to create a Permit rule for the specific IP address and apply a desired Action, and ensure that the rule is listed above the general rule in the zone-based rules table.

If you decide to use Deny rules, be sure to also read [Troubleshooting Zone-based Rules and Configurations, page 21-53](#).

- Action**—The Action parameters define what happens to traffic that matches a Permit rule. These parameters are ignored for Deny rules, except to determine to which class map the rule is added.
 

When you create a Permit rule, traffic that matches the Source, Destination, Services, and Protocol fields is processed according to the Action you choose: drop the traffic (and optionally log it), pass the traffic (and optionally log it), inspect the traffic, or apply content filtering (for Web traffic only).

When you inspect traffic for some protocols, or perform content filtering, you have the option of specifying a policy map to use for deep inspection. The deep inspection policy map also specifies actions based on the deeper characteristics of the traffic. This additional inspection applies to packets that meet the requirements of the class map to which the assigned policy map refers. Packets that do not match the deep inspection class map are allowed. Thus, deep inspection might reset TCP connections if the policy map specifies that action.

The following table illustrates the relationship between Permit/Deny and the chosen Action in a zone-based firewall rule. The table uses the TCP service as an example, but the general explanation applies to the IP service as well. The result applies only to the From and To zones specified in the rule.

**Table 21-1 Relationship Between Permit/Deny and Action in Zone-based Rules**

| Permit / Deny | Service | Rule Action | Protocol | Result                                                                                                                                                                               |
|---------------|---------|-------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Permit        | TCP     | Pass        | (None)   | Pass all TCP traffic.                                                                                                                                                                |
| Deny          | TCP     | Pass        | (None)   | Skip the rule and evaluate the next class map. Either a subsequent class map with a Permit rule is applied, or the class default rule is applied.<br><br>The Pass action is ignored. |
| Permit        | TCP     | Drop        | (None)   | Drop all TCP traffic.                                                                                                                                                                |
| Deny          | TCP     | Drop        | (None)   | Skip the rule and evaluate the next class map. Either a subsequent class map with a Permit rule is applied, or the class default rule is applied.<br><br>The Drop action is ignored. |
| Permit        | TCP     | Pass        | DNS      | Only DNS traffic passes. Other TCP traffic is handled by subsequent rules.                                                                                                           |
| Permit        | TCP     | Drop        | DNS      | DNS traffic is dropped. Other TCP traffic is handled by subsequent rules.                                                                                                            |

**Table 21-1** Relationship Between Permit/Deny and Action in Zone-based Rules (Continued)

| Permit / Deny | Service | Rule Action | Protocol | Result                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|---------|-------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Deny          | TCP     | Pass        | DNS      | <p>Skip the rule for DNS traffic and evaluate the next class map. Either a subsequent class map with a Permit rule is applied, or the class default rule is applied.</p> <p>The Pass action is ignored.</p>                                                                                                                                                                                                                                                                                                                                                      |
| Deny          | TCP     | Drop        | DNS      | <p>Skip the rule for DNS traffic and evaluate the next class map. Either a subsequent class map with a Permit rule is applied, or the class default rule is applied.</p> <p>The Drop action is ignored.</p>                                                                                                                                                                                                                                                                                                                                                      |
| Permit        | TCP     | Inspect     | HTTP     | <p>Allow and inspect HTTP traffic. If you specify a policy map for deep inspection, the action from the policy map is applied to any packets that match deep inspection parameters (for example, reset the connection for protocol violations).</p>                                                                                                                                                                                                                                                                                                              |
| Deny          | TCP     | Inspect     | HTTP     | <p>Skip the rule for HTTP traffic and evaluate the next class map. Either a subsequent class map with a Permit rule is applied, or the class default rule is applied.</p> <p>The Inspect action is ignored.</p> <p><b>Tip</b> If subsequent rules, or the class default, pass the traffic without inspection, you need to create a Permit/Pass rule in the other direction (or an access rule) to allow return traffic for the HTTP connection. If your intention is to prohibit HTTP connections, create a Permit/Drop rule instead of a Deny/Inspect rule.</p> |

Table 21-1 Relationship Between Permit/Deny and Action in Zone-based Rules (Continued)

| Permit / Deny | Service | Rule Action    | Protocol | Result                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|---------|----------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Permit        | TCP     | Content Filter | HTTP     | <p>Allow and inspect HTTP traffic, and apply URL filtering maps to selectively permit or deny Web connections based on the Web sites requested.</p> <p>If you specify a policy map for deep inspection, the action from the policy map is applied to any packets that match deep inspection parameters (for example, reset the connection for protocol violations).</p> <p>Thus, traffic can be dropped either because the Web site is blacklisted, or because the HTTP packets violate your deep inspection rules.</p>        |
| Deny          | TCP     | Content Filter | HTTP     | <p>Skip the rule for HTTP traffic and evaluate the next class map. Either a subsequent class map with a Permit rule is applied, or the class default rule is applied.</p> <p>The Content Filter action is ignored.</p> <p><b>Tip</b> This type of rule can exempt the specified source/destination from content filtering if no subsequent class maps drop the traffic or apply content filtering. However, if you want to allow HTTP connections for this traffic, you must create a Permit/Inspect rule for the traffic.</p> |

## Understanding the Relationship Between Services and Protocols in Zone-based Firewall Rules

When you create a zone-based firewall rule, there are two seemingly similar parameters which help identify the characteristics of the target traffic: Services and Protocols. The entries in these fields can provide very similar information, but it is used differently when constructing zone-based firewall policies in the device configuration. This section describes the recommended uses of these fields.

- **Services** – The Services field is used to define traffic protocol(s) in an access control list (ACL) entry. Along with the Sources and Destinations specified, this ACL entry is used by a class map to define the traffic to which you want to apply a policy. However, unlike in standard access rules, the Services information is not the primary means of identifying the traffic protocol. It is required only because ACLs must have a service designation for each entry.

In general, you can leave the default entry (IP) in the Services field for all of your zone-based firewall rules, using the Protocol table to identify specific protocols that you want to Drop, Pass, or Inspect.

If you do elect to specify a Service other than IP, ensure that your selection does not conflict with any protocols listed in the Protocol table. For example, do not specify UDP in the Services field, and then list a TCP-based protocol in the table. In general, for a given rule, if you specify a specific service in the Services field, do not enter any protocols in the Protocol table.

- **Protocol** – The Protocol table, in the Action area of the Add and Edit Zone Based Rule dialog boxes, is used to select one or more protocols, add custom port application mappings (if you specify non-default ports), and apply deep inspection policy maps. You can specify very specific protocols, such as DNS, general protocols such as TCP and UDP, and even custom protocols that identify ports you use for special applications.

As a general rule, leave Services set to IP and use the Protocol table to identify the protocols (which are also services) for all of your zone-based rules for the Drop, Pass, and Inspect actions. (The Content Filter action automatically uses the HTTP protocol, which you can configure but not change.) Following this approach will create a configuration that is as “clean” and easy to interpret (and troubleshoot) as possible.

For more detailed information on how these fields are used when generating device configurations, see [Troubleshooting Zone-based Rules and Configurations, page 21-53](#).

## General Recommendations for Zone-based Firewall Rules

Zone-based firewall rules allow a wide variety of configurations. You can quickly generate a set of rules that will be very complex and difficult to analyze, because you can use the zone-based rules in place of the standard access rules, inspection rules, and Web filter rules.

When defining zone-based rules, strive to keep them as simple and straightforward as possible. Consider the following recommendations for helping to maintain simplicity in your zone-based firewall policy:

- Only use **Permit** rules. The chosen Action determines what happens to matched traffic, and **Deny** rules are difficult to analyze. For more information, see [Understanding the Relationship Between Permit/Deny and Action in Zone-based Firewall Rules, page 21-7](#).
- The **Drop** and **Pass** rules are equivalent to standard interface access rules, but are applied to the specified zone pair. You can use either the Services field or the Protocol table to identify the type of traffic, but we recommend using the Protocol table exclusively. To drop traffic, specify **Permit** with the Action **Drop**.
- You do not need to first pass traffic before inspecting it. For example, if you want to allow HTTP traffic between zones, you need only a single Permit/Inspect rule; you do not need to first create a Permit/Pass rule. If you do use Pass rules, note that you must also create a Pass rule in the return direction if you want to allow returning traffic. In practice, you generally can avoid creating Pass rules, using only Inspect rules.
- You can use Permit/Pass and Permit/Drop rules to perform the same functions as standard access rules. Thus, you can eliminate your access rules policy and use only zone-based firewall rules.

However, because there are several tools available for analyzing interface access rules, and Security Manager allows you to use the same interface roles in zone-base rules and access rules, you might find it more convenient to create your Pass/Drop policies (which are Permit/Deny in standard access rules) in the access rules table instead of the zone rules table. Use the zone rules table primarily for zone-based Inspection and Content Filter rules.

- Use sections to organize the rules for each zone pair. Sections make it easy for you to see all of the rules for a pair, which can be critical if your rules have sequential dependencies. For more information on working with sections, see [Using Sections to Organize Rules Tables, page 12-20](#).

## Developing and Applying Zone-based Firewall Rules

The following is a general overview of how to develop and apply zone-based firewall rules to your network.

- Consider your network, and its sub-networks, in terms of security zones—think about the security requirements of the various zones. As a general guideline, group router interfaces that are similar when viewed from a security perspective.
- Determine the types of traffic to be examined as it travels from one zone to another, decide how each type is to be examined and handled.
- Define zone-based firewall rules that implement these decisions. This process may include some or all of the following procedures, which you can perform prior to defining the rules themselves, or which you can perform as necessary during rule definition:
  - Define the zones by creating named Interface Role objects, assigning the appropriate interfaces and interface patterns to them.
  - Define/edit Port Application Mapping (PAM) settings for specific Layer 4 protocols and ports, and optionally specific networks and hosts.
  - Configure Deep Packet Inspection (DPI) policies for Layer 7 protocols—HTTP, IMAP, instant messaging (IM), and peer-to-peer (P2P).
  - Configure Protocol Info parameter maps; these define DNS servers that interact with the IM applications.
  - Configure Inspect parameter maps that define connection, timeout, and other settings for the Inspect action.
  - Define WebFilter parameter or policy maps for URL-based content filtering.

The following topics provide additional information about these procedures:

- [Understanding Map Objects, page 6-72](#)
- [Configuring Content Filtering Maps for Zone-based Firewall Policies, page 21-35](#)
- [Configuring Inspection Maps for Zone-based Firewall Policies, page 21-15](#)

## Adding Zone-Based Firewall Rules

This procedure explains how to configure a zone-based firewall rule in Security Manager.

### Related Topics

- [Understanding the Zone-based Firewall Rules, page 21-3](#)
- [Configuring Settings for Zone-based Firewall Rules, page 21-48](#)
- [Understanding Map Objects, page 6-72](#)
- [Enabling and Disabling Rules, page 12-20](#)
- [Adding and Removing Rules, page 12-9](#)

- [Moving Rules and the Importance of Rule Order, page 12-19](#)

- Step 1** Access the [Zone-based Firewall Rules Page, page 21-57](#) as follows:
- (Device view) Select an IOS router and then select **Firewall > Zone Based Firewall Rules** from the Policy selector.
  - (Policy view) Select **Firewall > Zone Based Firewall Rules** from the Policy Type selector. Select an existing policy or create a new one.

- Step 2** Click the Add Row button below the rules table, or right-click anywhere inside the table, and choose **Add Row** to open the Add Zone Based Firewall Rule dialog box.

Refer to [Adding and Editing Zone-based Firewall Rules, page 21-59](#) for a complete description of this dialog box.

- Step 3** Define the base Traffic flow for this rule.

**Note** Together, the Permit/Deny, Sources, Destinations, and Services options can be thought of as defining a simple access rule that can be enhanced by the application of in-depth Action-related policies, and restricted to a specific direction between a specific pair of zones.

- Choose whether to Permit or Deny further processing of traffic that matches this rule. See [Understanding the Relationship Between Permit/Deny and Action in Zone-based Firewall Rules, page 21-7](#) for more information.
- Optionally, provide Source and Destination hosts/networks.  
By default, the traffic definition encompasses packets from “any” source, to “any” destination. You can use these fields to refine this base traffic definition by providing one or more source and destination hosts/networks. (Refer [Understanding Networks/Hosts Objects, page 6-74](#) to for more information.)
- Specify one or more Services (protocols) that indicate the type of traffic; for example, IP, TCP, etc.  
You can provide more than one Service; however, IP generally stands alone. (See [Understanding and Specifying Services and Service and Port List Objects, page 6-86.](#))
- Provide the From Zone; that is, the only zone from which matched traffic can originate.
- Provide the To Zone; that is, the only zone to which matched traffic can flow.

Refer to [Understanding Interface Role Objects, page 6-67](#) for more information about zone/interface objects.

**Note** Together, the From Zone and the To Zone constitute what is sometimes referred to as a “zone-pair.”

- Click the Advanced button to add a time range, or to apply a packet-fragment or an established-connection restriction to this zone-based firewall rule.  
See [Zone-based Firewall Rule: Advanced Options Dialog Box, page 21-63](#) for more information about these options.

- Step 4** Specify the actions to be applied to traffic matching this definition by choosing a base Action, and supplying additional parameters as necessary.

- Choose a base Action:

- **Drop** – Matching traffic is silently dropped; no notification of the drop is sent to the originating host.
- **Drop and Log** – Matching traffic is dropped and a syslog message generated; no notification of the drop is sent to the originating host.
- **Pass** – Traffic is forwarded. This action is unidirectional; Pass allows traffic in only the specified direction.
- **Pass and Log** – Traffic is forwarded and a syslog message generated.

**Note**

The Pass actions do not track the state of connections or sessions within the traffic. Pass only allows the traffic in one direction. A corresponding rule must be defined to allow return traffic. The Pass actions are useful for protocols such as IPsec ESP, IPsec AH, ISAKMP, and other inherently secure protocols with predictable behavior. However, most application traffic is better handled in the zone-based firewall rules with the Inspect action.

- **Inspect** – This option offers state-based traffic control—the device maintains connection or session information for TCP and UDP traffic, meaning return traffic in reply to connection requests is permitted.

Choose this option to apply packet inspection based on your selected Layer 4 (TCP, UDP) and Layer 7 (HTTP, IMAP, instant messaging, and peer-to-peer) protocols. You also can edit the Port Application Mapping (PAM) settings for the selected protocols, and you can set up deep packet inspection (DPI) and provide additional protocol-related information for the Layer 7 protocols.

- **Content Filter** – Lets you configure HTTP content inspection (URL filtering) based on a WebFilter parameter map, or a WebFilter policy map. This action is generally equivalent to a Web Filter rule; however, zone-based firewall rules support additional advanced options, such as HTTP deep packet inspection (DPI).

The router intercepts HTTP requests, performs protocol-related inspection, and optionally contacts a third-party server to determine whether the requests should be allowed or blocked. You can provide a WebFilter parameter map, which defines filtering based on local URL lists, as well as information from an external SmartFilter (previously N2H2) or Websense server. Alternately, you can provide a WebFilter policy map that accesses Local, N2H2, Websense, or Trend Micro filtering data.

- For any Action except Content Filter, you can select and edit the specific traffic Protocol(s) to be considered:

Click Select next to the Protocol table to open the [Protocol Selector Dialog Box, page 21-64](#). Select one or more protocols and click >> to move them to the Selected Protocol list. You can edit the Port Application Mapping (PAM) settings for the selected protocols; see [Configure Protocol Dialog Box, page 21-65](#) for more information.

The Instant Messaging and Stun-ice protocols also allow selection of Protocol Info parameter maps. Further, when Inspect is the chosen Action, some protocols allow selection of deep-inspection policy maps.

See [Configuring Inspection Maps for Zone-based Firewall Policies, page 21-15](#), and [Configuring Protocol Info Parameter Maps, page 21-32](#) for more information.

**Note**

It is not necessary to specify protocols for the Drop, Drop and Log, Pass, and Pass and Log actions. You can leave the Protocol table empty and pass or drop traffic based on the Sources, Destinations, and Services parameters.

- c. When the chosen Action is Content Filter, configure the URL filtering:
    1. Click Configure next to the Protocol field to customize the HTTP PAM settings, and to apply an HTTP deep-inspection policy map. See the [Configure Protocol Dialog Box, page 21-65](#) for more information
    2. Select either WebFilter Parameter Map, or WebFilter Policy Map, and enter or Select the name of the appropriate WebFilter map. See [Configuring Content Filtering Maps for Zone-based Firewall Policies, page 21-35](#) for more information.
  - d. When the chosen Action is Inspect or Content Filter, you can enter or Select the name of an Inspect Parameter map to apply a customized set of connection, timeout, and other settings. See [Configuring Inspect Parameter Maps, page 21-29](#) for more information.
- Step 5** (Optional) Enter a description to help you identify the rule.
- Step 6** (Optional) Under Category, select a category to help you identify this rule in the rules table. See [Using Category Objects, page 6-12](#).
- Step 7** Click **OK** to close the Add Zone Based Firewall Rule dialog box and return to the Zone Based Firewall Rules table.

The new rule is listed in the table.

---

## Configuring Inspection Maps for Zone-based Firewall Policies

When you configure zone-based firewall policies for a router, you can define rules to inspect traffic by choosing Inspect as the Action for the rule. You can then select the specific protocols to inspect.

For some protocols, you can select policy maps to perform deep inspection on packets that match your criteria. You can configure these maps from the policy object selector dialog box while defining the rule, or at any time in the Policy Object Manager window (select **Manage > Policy Objects**). In addition to policy maps, there are some parameter maps you can configure for inspection.

- For protocols that allow deep inspection, you can select a related policy map, which in turn incorporates class maps that define match conditions for the targeted traffic. To create these policy maps in the Policy Object Manager, select one of the available map types (which are listed in the following table) from the **Maps > Policy Maps > Inspect** folder, and review the detailed usage information in [Configuring Policy Maps for Zone-Based Firewall Policies, page 21-33](#).

For information on creating class maps for use in your deep-inspection policy maps, see the references to the match criterion dialog boxes in the following table, as well as the topic [Configuring Class Maps for Zone-Based Firewall Policies, page 21-17](#). These class map are found in the **Maps > Class Maps > Inspect** folder in the Policy Object Manager.

- When Inspect (or Content Filter) is the chosen Action, you can also apply an Inspect Parameters map in the [Adding and Editing Zone-based Firewall Rules](#). Zone-based firewall inspection includes several general settings, all of which have default values that are appropriate for most networks. If you want to adjust any of these settings, you must create an Inspect Parameters map. In the Policy Object Manager, select **Maps > Parameter Maps > Inspect > Inspect Parameters** and review the detailed usage information in [Configuring Inspect Parameter Maps, page 21-29](#).

**Table 21-2 Policy Objects for Zone-based Firewall Inspection Rules**

| <b>Protocol</b>                                                                | <b>Minimum IOS Software Version</b> | <b>Policy Map</b>     | <b>Class Map</b>                                                    | <b>Parameter Map</b> | <b>Description and Match Criteria Reference</b>                                                                                                                                                                                                                                                                                                                                                         |

## Configuring Class Maps for Zone-Based Firewall Policies

Use the Add and Edit Class Map dialog boxes to define class maps to be used in policy maps of the same type. The name of the dialog box indicates the type of map you are creating.

A class map defines application traffic based on criteria specific to the application. You then select the class map in the corresponding policy map and configure the action to take for the selected traffic. Thus, each class map must contain traffic that you want to handle in the same way (for example, to allow it or to drop it).

When configuring zone-based firewall rules for devices running Cisco IOS Software, you can create class maps for the following purposes:

- For 12.4(6)T and higher, you can create classes for the inspection of the following types of traffic: H.323, HTTP, IMAP, POP3, SIP, SMTP, and Sun RPC. You can create classes for web filtering using the following class types: Local, N2H2 (SmartFilter), and WebSense. See the following topics for information on the match criteria:
  - [H.323 \(IOS\) Class Maps Add or Edit Match Criterion Dialog Boxes](#), page 21-21
  - [HTTP \(IOS\) Class Add or Edit Match Criterion Dialog Boxes](#), page 21-21
  - [IMAP and POP3 Class Maps Add or Edit Match Criterion Dialog Boxes](#), page 21-23
  - [SIP \(IOS\) Class Add or Edit Match Criterion Dialog Boxes](#), page 21-24
  - [SMTP Class Maps Add or Edit Match Criterion Dialog Boxes](#), page 21-25

- [Local Web Filter Class Add or Edit Match Criterion Dialog Boxes, page 21-28](#)
- [N2H2 and Websense Class Add or Edit Match Criterion Dialog Boxes, page 21-29](#)
- For 12.4(9)T and higher, you can create classes for the inspection of the following types of traffic: AOL, eDonkey, FastTrack, Gnutella, ICQ, Kazaa2, MSN Messenger, Windows Messenger, and Yahoo Messenger. See the following topics for information on the match criteria:
  - [Zone-based Firewall IM Application Class Maps: Add or Edit Match Condition Dialog Boxes, page 21-20](#)
  - [Zone-based Firewall P2P Application Class Maps: Add or Edit Match Condition Dialog Boxes, page 21-20](#)
- For 12.4(20)T and higher, you can create classes for web filtering using the Trend policy object. Match criteria for Trend Content Filter class maps is described in the table below.

### Navigation Path

Select **Manage > Policy Objects**, then select any zone-based class map object in the folders in the **Maps > Class Maps** folder in the table of contents. Right-click inside the work area, then select **New Object**, or right-click a row, then select **Edit Object**.

| Match table<br>Match Type<br>(Except for Trend Content Filter class maps.) | <p>The Match table lists the criteria included in the class map. Each row indicates whether the inspection is looking for traffic that matches or does not match each criterion and the criterion and value that is inspected.</p> <p>The name of the table indicates whether every one of the criteria must be met for the traffic to match the class (Match All), or whether matching any of the listed criteria is sufficient (Match Any). For the HTTP (IOS) and SMTP classes, you can choose whether to match all or any. When using a Match All table, if you add more than one criteria, ensure that you are not defining a set of characteristics that no traffic can match.</p> <p><b>Tip</b> Match All works for devices running Cisco IOS Software version 12.4(20)T or higher only.</p> <ul style="list-style-type: none"> <li>To add a criterion, click the Add button and fill in the Match Criterion dialog box. For more information, see the topics referenced above.</li> <li>To edit a criterion, select it and click the Edit button.</li> <li>To delete a criterion, select it and click the Delete button.</li> </ul> |
| Trend Content Filter Match Criteria                                        | <p>The match criteria for Trend Content Filter class maps differs from that of all other class maps. Instead of adding items to a table, you simply select the items you want from a list. Select the Enable checkbox for any of the Trend-Micro classifications on the following tabs. Traffic matches the class if it matches any of your selections.</p> <ul style="list-style-type: none"> <li>Productivity Categories—Matches the traffic to the category to which the URL belongs. For example, you can target traffic associated with gambling or pornography.</li> <li>Security Ratings—Matches the traffic to the security rating assigned to it by Trend-Micro. For example, you can target adware, which is traffic associated with advertising.</li> </ul> <p>See the Trend-Micro documentation for specific information on these categories or security classifications.</p>                                                                                                                                                                                                                                                   |
| Category                                                                   | <p>The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a>, page 6-12.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Allow Value Override per Device<br>Overrides<br>Edit button                | <p>Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a>, page 6-18 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a>, page 6-17.</p> <p>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Zone-based Firewall IM Application Class Maps: Add or Edit Match Condition Dialog Boxes

Use the Add or Edit Match Criterion dialog boxes for the various instant messenger (IM) application classes used with zone-based firewall policies to define a match criterion and value for the class map.

You can define a match for the following types of traffic:

- Any—Any type of traffic from the application except text chat traffic.
- Text-chat—Text chat traffic.

### Navigation Path

From the Add or Edit Class Maps dialog boxes for AOL, ICQ, MSN Messenger, Windows Messenger, or Yahoo Messenger classes, right-click inside the table and select **Add Row** or right-click a row and select **Edit Row**. See [Configuring Class Maps for Zone-Based Firewall Policies, page 21-17](#).

### Related Topics

- [Understanding Map Objects, page 6-72](#)

## Zone-based Firewall P2P Application Class Maps: Add or Edit Match Condition Dialog Boxes

Use the Add or Edit Match Criterion dialog boxes for the various peer-to-peer (P2P) application classes used with zone-based firewall policies to define a match criterion and value for the class map.

### Navigation Path

From the Add or Edit Class Maps dialog boxes for eDonkey, FastTrack, Gnutella, or Kazaa2 classes, right-click inside the table and select **Add Row**, or right-click a row and select **Edit Row**. See [Configuring Class Maps for Zone-Based Firewall Policies, page 21-17](#).

### Related Topics

| Element   | Description                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criterion | Choose which criterion to match: <ul style="list-style-type: none"> <li>• File Transfer – Matches file-transfer traffic.</li> <li>• Search Filename – Matches the names of files for which the user is searching. You can use this criterion to block users from searching for particular files using eDonkey.</li> <li>• Text Chat – Matches eDonkey text chat traffic.</li> </ul> |
| Type      | Specifies that the map includes traffic that matches the criterion.                                                                                                                                                                                                                                                                                                                 |

**Table 21-4 Zone-based Firewall P2P Application Class Maps Add or Edit Match Condition Dialog Boxes (Continued)**

| Element   | Description                                                                                                                                                                                                                                                                                                                         |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| File Name | The name of the file associated with the traffic. You can use regular expressions to specify a name pattern. For information on the metacharacters you can use to build regular expressions, see <a href="#">Metacharacters Used to Build Regular Expressions, page 17-87</a> .<br><b>Tip</b> eDonkey does not require a file name. |

### H.323 (IOS) Class Maps Add or Edit Match Criterion Dialog Boxes

Use the Add or Edit Match Criterion dialog boxes for the H.323 (IOS) class used with zone-based firewall policies to define a match criterion and value for the class map. You can match traffic based on the H.323 protocol message type. Select the message that you want to match.

#### Navigation Path

From the Add or Edit Class Maps dialog boxes for the H.323 (IOS) class, right-click inside the table and select **Add Row** or right-click a row and select **Edit Row**. See [Configuring Class Maps for Zone-Based Firewall Policies, page 21-17](#).

### HTTP (IOS) Class Add or Edit Match Criterion Dialog Boxes

Use the Add or Edit Match Criterion dialog boxes for the HTTP (IOS) class used with zone-based firewall policies to define a match criterion and value for the class map.

The fields on this dialog box change based on the criterion you select. You can use the following criteria:

- Request/Response Body Length, Request Body Length, Response Body Length—Specifies that the body length of the request, response, or both, is less than or greater than the specified number. This allows you to set a minimum or maximum message length.
- Request/Response Body, Request Body, Response Body—Applies a regular expression to match the body of the request, response, or both.
- Request/Response Header, Request Header, Response Header—You can match a regular expression against the header, test for repeated fields, check the content type, or check the total length or number of records in the header.
- Request/Response Protocol Violation—Matches non-compliant HTTP traffic.
- Request Argument, Request URI—Matches the length or content (with a regular expression) of the argument (parameters) or uniform resource identifier (URI) in a request message.
- Request Port Misuse—Matches the misuse of ports by certain types of applications.
- Response Body Java Applet—Matches Java applets in an HTTP connection.
- Response Header Status Line—Applies a regular expression to match the content of the status line in the header.

**Navigation Path**

From the Add or Edit Class Maps dialog boxes for the HTTP (IOS) class, right-click inside the table and select **Add Row** or right-click a row and select **Edit Row**. See [Configuring Class Maps for Zone-Based Firewall Policies](#), page 21-17.

**Field Reference**

**Table 21-5** HTTP (IOS) Class Add or Edit Match Criterion Dialog Boxes

| Element   | Description                                                                           |
|-----------|---------------------------------------------------------------------------------------|
| Criterion | Specifies which criterion of HTTP traffic to match. The criteria are described above. |
| Type      | Specifies that the map includes traffic that matches the criterion.                   |

**Variable Fields**

The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see.

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Less Than Length     | The minimum length in bytes of the evaluated field. The criterion matches if the length is less than the specified number.                                                                                                                                                                                                                                                                                                                                                                        |
| Greater Than Length  | The maximum length in bytes of the evaluated field. The criterion matches if the length is greater than the specified number.                                                                                                                                                                                                                                                                                                                                                                     |
| Header Option        | The type of header record. If you do not select a record type, the count or expression is applied to all records in the header. If you select a record type, those selections are applied only to the records of the selected type. If you select content type or transfer encoding, you can make additional selections related to those types.                                                                                                                                                   |
| Request Method       | The request method you want to match.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Value (Content Type) | If you select content-type in the Header Option field, you can select these types: <ul style="list-style-type: none"> <li>• Mismatch—Verifies the content-type of the response message against the accept field value of the request message.</li> <li>• Unknown—The content type is not known. Select Unknown when you want to evaluate the item against all known MIME types.</li> <li>• Violation—The content-type definition and the content type of the actual body do not match.</li> </ul> |

**Table 21-5 HTTP (IOS) Class Add or Edit Match Criterion Dialog Boxes (Continued)**

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Encoding Type      | <p>If you select transfer encoding in the Header Option field, you can select these types:</p> <ul style="list-style-type: none"> <li>All—All of the transfer encoding types.</li> <li>Chunked—The message body is transferred as a series of chunks; each chunk contains its own size indicator.</li> <li>Compress—The message body is transferred using UNIX file compression.</li> <li>Deflate—The message body is transferred using zlib format (RFC 1950) and deflate compression (RFC 1951).</li> <li>GZIP—The message body is transferred using GNU zip (RFC 1952).</li> <li>Identity—No transfer encoding is performed.</li> </ul> |
| Greater Than Count | <p>The maximum number of records allowed in the header. If you select a specific header option, the count applies to those types of records. If you do not select a specific header option, the count applies to the total number of records in the header without regard to type.</p>                                                                                                                                                                                                                                                                                                                                                     |
| Regular Expression | <p>The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression object.</p>                                                                                                                                                                                                                                                                                                                                                                   |
| Port Misuse        | <p>The type of request port misuse you want to match. Your options are:</p> <ul style="list-style-type: none"> <li>Any—Any of the listed types of misuse.</li> <li>IM—Instant messaging protocol applications subject to inspection.</li> <li>P2P—Peer-to-peer protocol applications subject to inspection.</li> <li>Tunneling—Tunneling applications subject to inspection: HTTPPort/HTTPHost.</li> </ul>                                                                                                                                                                                                                                 |

## IMAP and POP3 Class Maps Add or Edit Match Criterion Dialog Boxes

Use the Add or Edit Match Criterion dialog boxes for the Internet Message Access Protocol (IMAP) and Post Office Protocol 3 (POP3) classes used with zone-based firewall policies to define a match criterion and value for the class map.

You can select the following criteria to identify matching traffic:

- Invalid Command—Matches commands that are not valid on a POP3 server or IMAP connection.
- Login Clear Text—Matches non-secure logins, where the password is being provided in clear text.

### Navigation Path

From the Add or Edit Class Maps dialog boxes for the IMAP or POP3 classes, right-click inside the table and select **Add Row** or right-click a row and select **Edit Row**. See [Configuring Class Maps for Zone-Based Firewall Policies, page 21-17](#).

**Related Topics**

- [Understanding Map Objects, page 6-72](#)

**SIP (IOS) Class Add or Edit Match Criterion Dialog Boxes**

Use the Add or Edit Match Criterion dialog boxes for the SIP (IOS) class used with zone-based firewall policies to define a match criterion and value for the class map.

The fields on this dialog box change based on the criterion you select.

**Navigation Path**

From the Add or Edit Class Maps dialog boxes for the SIP (IOS) class, right-click inside the table and select **Add Row** or right-click a row and select **Edit Row**. See [Configuring Class Maps for Zone-Based Firewall Policies, page 21-17](#).

**Related Topics**

- [Understanding Map Objects, page 6-72](#)
- [Configuring Inspection Maps for Zone-based Firewall Policies, page 21-15](#)

**Field Reference**

**Table 21-6** SIP (IOS) Class Add or Edit Match Criterion Dialog Boxes

| Element   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criterion | Specifies which criterion of traffic to match. You can select from the following: <ul style="list-style-type: none"> <li>• Protocol Violation—Matches traffic that violates the protocol.</li> <li>• Request/Response Header Options—Matches a regular expression against the selected request or response header field.</li> <li>• Request Options—Matches the request method or matches a regular expression against the selected request header field.</li> <li>• Response Options—Matches a regular expression against the selected response header field or status message.</li> </ul> |
| Type      | Specifies that the map includes traffic that matches the criterion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Variable Fields**

The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see.

|        |                                                                                                                                               |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| Header | The type of header in the request or response message. The regular expression is matched against the content of headers of the selected type. |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------|

**Table 21-6 SIP (IOS) Class Add or Edit Match Criterion Dialog Boxes (Continued)**

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Method             | <p>The request method you want to inspect:</p> <ul style="list-style-type: none"> <li>• <b>ack</b>—Acknowledges that the previous message is valid and accepted.</li> <li>• <b>bye</b>—Signifies the intention to terminate a call.</li> <li>• <b>cancel</b>—Terminates any pending request.</li> <li>• <b>info</b>—Communicates mid-session signaling information along the signaling path for the call.</li> <li>• <b>invite</b>—Sets up a call.</li> <li>• <b>message</b>—Sends an instant message.</li> <li>• <b>notify</b>—Informs subscribers of state changes.</li> <li>• <b>options</b>—Queries the capabilities of another user agent or a proxy server.</li> <li>• <b>prack</b>—Provides reliable transfer of provisional response messages.</li> <li>• <b>refer</b>—Indicates that the recipient should contact a third party using the contact information provided in the request.</li> <li>• <b>register</b>—Includes a contact address to which SIP requests for the address-of-record should be forwarded.</li> <li>• <b>subscribe</b>—Requests notification of an event or set of events at a later time.</li> <li>• <b>update</b>—Permits a client to update parameters of a session but has no impact on the state of a dialog.</li> </ul> |
| Status             | The regular expression is matched against the status line in the response.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Regular Expression | The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## SMTP Class Maps Add or Edit Match Criterion Dialog Boxes

Use the Add or Edit Match Criterion dialog boxes for the SMTP classes used with zone-based firewall policies to define a match criterion and value for the class map.

### Tip

Only the Data Length criterion is available for routers running Cisco IOS Software lower than 12.4(20)T.

The fields on this dialog box change based on the criterion you select. You can use the following criteria:

- **Data Length**—Specifies that the data length of the traffic is greater than the specified number. You can match the data length of the traffic to determine if the data transferred in an SMTP connection exceeds the specified length in bytes. By default, inspection keeps data length below 20.

- **Body Regular Expression**—Applies a regular expression to match the content types and content encoding types for text and HTML in the body of an e-mail message. Only text or HTML that uses 7-bit or 8-bit encoding is checked. The regular expression cannot be scanned in messages that use another encoding type (such as base64 or zip files).
- **Command Line Length**—Specifies that the length of the ESMTP command line not be greater than the specified number. Use this to thwart Denial of Service (DoS) attacks.
- **Command Verb**—Limits inspection to the selected SMTP or ESMTP command. If you configure inspection for SMTP, all commands are inspected unless you limit them.
- **Header Length**—Specifies that the length of the SMTP header is greater than the specified number. Use this to thwart DoS attacks by limiting the possible size of the header.
- **Header Regular Expression**—Applies a regular expression to match the content of the header of an e-mail message. For example, you can use this to test for particular patterns in the subject, from, or to fields.
- **Mime Content-Type Regular Expression**—Applies a regular expression to match the Multipurpose Internet Message Exchange (MIME) content type of an e-mail attachment. Use this to prevent the transmission of undesired types of attachments.
- **Mime Encoding**—Specifies the MIME encoding type for e-mail attachments that you want to inspect. You can use this to identify unknown or non-standard encodings to restrict their transmission.
- **Recipient Address**—Applies a regular expression to match the recipient of an e-mail message in the SMTP RCPT command. Use this to search for a non-existent recipient, which might help you identify the source of spam.
- **Recipient Count**—Specifies that the number of recipients for an e-mail message cannot be greater than the specified number. Use this to prevent spammers from sending e-mails to a large number of users.
- **Recipient Invalid Count**—Specifies that the number of invalid recipients for an e-mail message cannot be greater than the specified number. Use this prevent spammers from sending e-mails to a large number common names, where they are fishing for real addresses. SMTP typically replies with a “no such address” message when an address is invalid; by putting a limit on the number of invalid addresses, you can prevent these replies to spammers.
- **Reply EHLO**—Specifies the service extension parameter in an EHLO server reply. Use this to prevent a client from using a particular service extension.
- **Sender Address**—Applies a regular expression to match the sender of an e-mail message. Use this to block specific senders, such as known spammers, from sending e-mail messages through the device.

### Navigation Path

From the Add or Edit Class Maps dialog boxes for SMTP classes, right-click inside the table and select **Add Row** or right-click a row and select **Edit Row**. See [Configuring Class Maps for Zone-Based Firewall Policies, page 21-17](#).

| Criterion                                                                                                                        | Specifies which criterion of SMTP traffic to match. The criteria are described above.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Type                                                                                                                             | Specifies that the map includes traffic that matches the criterion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Variable Fields</b>                                                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Greater Than Length                                                                                                              | The maximum length in bytes of the evaluated field. The criterion matches if the length is greater than the specified number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Greater Than Count                                                                                                               | The maximum number of recipients or invalid recipients allowed in the e-mail message. The criterion matches if the number is greater than the specified number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Verb Option<br>User Defined Format<br>(For the Command Verb criterion.)                                                          | The SMTP or ESMTP command that you want to inspect. If you select User Defined, you must enter the text string that corresponds to a word in the body of the e-mail message. The word cannot include spaces or special characters; only alphanumeric characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Service Extension Parameter<br>User Defined Format<br>(For the Reply EHLO criterion.)                                            | The service extension parameter of an EHLO server reply that you want to inspect. Select one of the well-known parameters, or select User Defined to specify a private extension in the User Defined Format field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Encoding Format<br>User Defined Format                                                                                           | The MIME encoding format for which you want to test. Encoding types are: <ul style="list-style-type: none"> <li>• 7-bit—ASCII encoding.</li> <li>• 8-bit—Used for the exchange of e-mail messages containing octets outside the 7-bit ASCII range.</li> <li>• base64—Encodes binary data by treating it numerically and translating it into a base 64 representation.</li> <li>• quoted-printable-Encoding that uses printable characters to transmit 8-bit data over a 7-bit data path.</li> <li>• binary—Encodes using only 0 and 1.</li> <li>• unknown—Encoding type is not known.</li> <li>• x-uuencode-Nonstandard encoding.</li> <li>• user defined—An encoding type you define. If you select User Defined, you must enter the text string that defines the encoding type you are looking for.</li> </ul> |
| Regular Expression                                                                                                               | The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new regular expression object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Sun RPC Class Maps Add or Edit Match Criterion Dialog Boxes

Use the Add or Edit Match Criterion dialog boxes for the Sun Remote Procedure Call (RPC) classes used with zone-based firewall policies to define a match criterion and value for the class map. You can enter the RPC protocol number that you want to match. See the Sun RPC documentation for information about protocol numbers.

### Navigation Path

From the Add or Edit Class Maps dialog boxes for Sun RPC classes, right-click inside the table and select **Add Row** or right-click a row and select **Edit Row**. See [Configuring Class Maps for Zone-Based Firewall Policies, page 21-17](#).

## Local Web Filter Class Add or Edit Match Criterion Dialog Boxes

Use the Add or Edit Match Criterion dialog boxes for the Local web filter class to define a match criterion and value for the class map.

### Navigation Path

From the Add or Edit Class Maps dialog boxes for the Local web filter class, right-click inside the table and select **Add Row** or right-click a row and select **Edit Row**. See [Configuring Class Maps for Zone-Based Firewall Policies, page 21-17](#).

| Element   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criterion | Specifies which criterion of traffic to match. You can select from the following: <ul style="list-style-type: none"> <li>• <b>Server Domain</b>—Matches traffic based on the name of the server. The URLF Glob parameter map you select should specify server domain names such as *.cisco.com or www.cisco.com.</li> <li>• <b>URL Keyword</b>—Matches traffic based on keywords in the URLs. A key word is any complete string that occurs between / characters in a URL. For example, in the URL segment www.cisco.com/en/US, en and US are examples of keywords.</li> </ul> |
| Type      | Specifies that the map includes traffic that matches the criterion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Table 21-8 Local Web Filter Class Add or Edit Match Criterion Dialog Boxes (Continued)**

| Element                 | Description                                                                                                                                                                                                                                                                                                                                        |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| URLF Glob Parameter Map | <p>The URLF Glob parameter map object that defines the URL patterns that you want to match. Ensure that the object you select has the appropriate content for the type of matching you selected.</p> <p>Enter the name of the object. You can click <b>Select</b> to choose the object from a list of existing ones or to create a new object.</p> |

## N2H2 and Websense Class Add or Edit Match Criterion Dialog Boxes

Use the Add or Edit Match Criterion dialog boxes for the N2H2 (SmartFilter) and Websense web filter classes to define a match criterion and value for the class map. The only match criterion available is to match any response from the SmartFilter or Websense server.

### Navigation Path

From the Add or Edit Class Maps dialog boxes for the N2H2 or Websense web filter class, right-click inside the table and select **Add Row** or right-click a row and select **Edit Row**. See [Configuring Class Maps for Zone-Based Firewall Policies, page 21-17](#).

## Configuring Inspect Parameter Maps

Use the Add and Edit Inspect Parameter Map dialog boxes to define a parameter map for inspection for zone-based firewall policies on routers. If you configure the action of a zone-based firewall policy rule as Inspect or Content Filter, you can select an inspect parameter map to define connection, timeout, and other settings for the inspection action. If you do not select an inspect parameter map for a zone-based firewall rule, the system uses default values for these settings.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Parameter Maps > Inspect > Inspect Parameters** in the table of contents. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

| <b>Element</b>                            | <b>Description</b>                                                                                                                                                                                                                                                                                                                         |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                                      | The name of the policy object. A maximum of 40 characters is allowed.                                                                                                                                                                                                                                                                      |
| Description                               | A description of the policy object. A maximum of 200 characters is allowed.                                                                                                                                                                                                                                                                |
| DNS Timeout                               | The length of time, in seconds, for which a DNS lookup session is managed while there is no activity.                                                                                                                                                                                                                                      |
| ICMP Timeout                              | The length of time, in seconds, for which an inactive ICMP (Internet Control Message Protocol) session is maintained.                                                                                                                                                                                                                      |
| Max Incomplete Low<br>Max Incomplete High | The number of existing half-open sessions that will cause the software to start (at the high threshold) and stop (at the low threshold) deleting half-open sessions.<br><br>Ensure that you enter a lower number in the Low field than you enter in the High field, for example, 400 and 500. The default is unlimited half-open sessions. |
| One Minute Low<br>One Minute High         | The number of new unestablished sessions that causes the system to start and stop deleting half-open sessions. Ensure that you enter a lower number in the Low field than you enter in the High field. The default is unlimited.                                                                                                           |
| Max Sessions                              | The maximum number of inspection sessions on a zone pair, for example, 200. The default is unlimited.                                                                                                                                                                                                                                      |
| TCP FINWAIT Timeout                       | How long to maintain TCP session state information after the firewall detects a FIN-exchange, in seconds. The FIN-exchange occurs when the TCP session is ready to close.                                                                                                                                                                  |
| TCP SYNWAIT Timeout                       | How long to wait for a TCP session to reach the established state before dropping the session, in seconds.                                                                                                                                                                                                                                 |
| TCP Idle Timeout                          | How long to maintain a TCP session while there is no activity in the session, in seconds.                                                                                                                                                                                                                                                  |

**Table 21-9 Add or Edit Inspect Parameter Map Dialog Boxes (Continued)**

| Element                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TCP Max Incomplete Hosts<br>TCP Max Incomplete Block Time | <p>The threshold and blocking time (in minutes) for TCP host-specific denial-of-service (DoS) detection and prevention.</p> <p>The maximum incomplete hosts is the number of half-open TCP sessions with the same host destination address that can simultaneously exist before the software starts deleting half-open sessions to that host. An unusually high number of half-open sessions with the same destination host address could indicate that a DoS attack is being launched against the host.</p> <p>When the threshold is exceeded, half-open sessions are dropped based on the maximum incomplete block time:</p> <ul style="list-style-type: none"> <li>• If the block time is 0, the software deletes the oldest existing half-open session for the host for every new connection request to the host. This ensures that the number of half-open sessions to a given host never exceeds the threshold.</li> <li>• If the block time is greater than 0, the software deletes all existing half-open sessions for the host and then blocks all new connection requests to the host. The software continues to block all new connection requests until the block time expires.</li> </ul> <p>The software sends syslog messages whenever the specified threshold is exceeded and when blocking of connection initiations to a host starts or ends.</p> |
| UDP Idle Timeout                                          | <p>How long to maintain a UDP session while there is no activity in the session, in seconds.</p> <p>When the software detects a valid UDP packet, the software establishes state information for a new UDP session. Because UDP is a connectionless service, there are no actual sessions, so the software approximates sessions by examining the information in the packet and determining if the packet is similar to other UDP packets (for example, it has similar source or destination addresses) and if the packet was detected soon after another similar UDP packet.</p> <p>If the software detects no UDP packets for the UDP session for the period of time defined by the UDP idle timeout, the software will not continue to manage state information for the session.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Enable Alert                                              | Whether to generate stateful packet inspection alert messages on the console.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Enable Audit Trail                                        | Whether audit trail messages are logged to the syslog server or router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Category                                                  | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-12</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Configuring Protocol Info Parameter Maps

Use the Add and Edit Protocol Info Parameter Map dialog boxes to define a parameter map for the inspection of Instant Messaging (IM) applications or the Stun-ice protocol for zone-based firewall policies on routers. If you configure the action of a zone-based firewall policy rule as Inspect, you must select a protocol info parameter map when you configure any of these applications: AOL, ICQ, MSN Messenger, Windows Messenger, Yahoo Messenger, Stun-ice. The protocol info parameter map defines the DNS servers that interact with these applications, which helps the instant messenger application engine to recognize the instant messenger traffic and to enforce the configured policy for that instant messenger application.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Parameter Maps > Inspect > Protocol Info Parameters** in the table of contents. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

## Add or Edit DNS Server for Protocol Info Parameters Dialog Box

Use the Add or Edit DNS Server dialog box to identify DNS servers for which traffic will be permitted (and inspected) or denied. These servers are defined in a Protocol Info parameter map for use with the inspection of protocols that require them in a zone-based firewall policy.

You can identify a server using any of these types:

- **Server Name**—The name of the DNS server. You can use an asterisk (\*) as a wildcard character to match one or more characters. For example, if you want to identify all DNS servers on the cisco.com domain, you can specify \*.cisco.com.
- **IP Address**—The IP address of a single DNS server.
- **IP Address Range**—A range of IP addresses identifying any DNS server within the start and end addresses.

### Navigation Path

From the Add or Edit Protocol Info Parameter Map dialog boxes, click the **Add** button beneath the server table, or select a server and click the **Edit** button. See [Configuring Protocol Info Parameter Maps](#), page 21-32.

## Configuring Policy Maps for Zone-Based Firewall Policies

Use the Add and Edit Policy Map dialog boxes for zone-based firewall policies to define the match criterion and values for an inspection map used in a zone-based firewall policy for a Cisco IOS router. You can create policy inspection maps for H.323 (IOS), HTTP (Zone based IOS), IM (Zone based IOS), IMAP, P2P, POP3, SIP (IOS), SMTP, and Sun RPC inspection, and the name of the dialog box indicates the type of map you are creating.

When defining the inspection map, you select class maps of the same type and define the action to take for matching traffic. You can configure the required class maps before creating the policy maps or while you are creating them.

### Navigation Path

Select **Manage > Policy Objects**, then any of the following items in the **Maps > Policy Maps > Inspect** folder in the table of contents: H.323 (IOS), HTTP (Zone based IOS), IM (Zone based IOS), IMAP, P2P, POP3, SIP (IOS), SMTP, and Sun RPC. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

The <b>Overrides</b> field indicates the number of devices that have overrides for this object.</p>                                                                                                                                                                         |

## Add or Edit Match Condition and Action Dialog Boxes for Zone-Based Firewall and Web Filter Policies

Use the Add or Edit Match Condition and Action dialog boxes for zone-based firewall and web filter policies to select the class maps for inspection and to define the action to take for traffic that matches the class. This dialog box is used for the following types of policy maps: H.323 (IOS), HTTP (Zone based IOS), IM (Zone based IOS), IMAP, P2P, POP3, SIP (IOS), SMTP, Sun RPC, Web Filter.

The fields on this dialog box differ slightly depending on the type of policy map you are defining.

**Navigation Path**

From the Add or Edit Policy Maps dialog boxes for Zone-Based Firewall Policies, right-click inside the match table and select **Add Row** or right-click a row and select **Edit Row**. See [Configuring Policy Maps for Zone-Based Firewall Policies, page 21-33](#).

You must define class maps when creating policy maps for zone-based firewall policies.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Class Map<br>P2P, IM, and Web Filter class map types. | The name of the class map for the type of policy map you are creating. Click <b>Select</b> to select the map from a list or to create a new class map object.<br><br>For P2P, IM, and Web Filter policy maps, you must also select the type of policy map you are creating. For example, in a P2P map you must select between eDonkey, FastTrack, Gnutella, and Kazaa2. In an IM (Zone Based IOS) map, you must select between AOL, MSN Messenger, Yahoo Messenger, Windows Messenger, and ICQ. In a Web Filter map, you must select between Local, N2H2, WebSense, and Trend. |
| Action                                                | The action you want the device to take for traffic that matches the selected class.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Configuring Content Filtering Maps for Zone-based Firewall Policies

When you configure zone-based firewall policies for a router, you can define rules to filter Web content by choosing Content Filter as the Action for the rule.

To filter Web content, you must configure certain map objects, which you can do from the policy object selector dialog box while defining the rule, or at any time in the Policy Object Manager window (select **Manage > Policy Objects**).

The type of maps required depends on the technique you are using to filter content, and on the Cisco IOS software version you are using. You can filter content based on URL lists defined locally on the device, or you can use external filtering servers such as SmartFilter (N2H2), Websense, or Trend Micro.

**Tip**

If you use an external server, you must have set up and configured the server appropriately based on the documentation for the type of server you select. If you use Trend Micro servers, you must specify the server details, and register the product and download certificates, on the Content Filtering tab of the Zone Based Firewall page (select Firewall > Settings > Zone Based Firewall). See [Zone Based Firewall Page, page 21-49](#).

The following are requirements for the map objects used with zone-based content filtering:

- For devices running releases below 12.4(20)T, you must create a URL Filter parameter map. In the Policy Object Manager, select **Maps > Parameter Maps > Web Filter > URL Filter**, and review the detailed usage information in [Configuring URL Filter Parameter Maps, page 21-42](#).
  - To perform local filtering on the router using lists of allowed (whitelisted) and denied (blacklisted) hosts, create the lists on the Local Filtering tab. Any Web access request is first compared to these lists before the request is sent on to an external filtering server (if you have configured one). These lists contain either complete domain names (such as www.cisco.com), or partial names (such as cisco.com), but they do not include paths or page names, and you cannot use wildcards.
  - To use a SmartFilter (N2H2) or Websense server, configure the type of server you are using and its address information on the External Filter tab. You can also configure other settings that control communication with the server. You cannot configure a Trend Micro server using the URL Filter parameter map.
- For devices running release 12.4(20)T and higher, the preferred approach is to use a Web Filter policy map. Although Web Filter policy maps are more complex, they provide added flexibility, and they let you access Trend Micro filtering servers. In the Policy Object Manager, select **Maps > Policy Maps > Web Filter > Web Filter**, and review the detailed usage information in [Configuring Web Filter Maps, page 21-46](#).

A Web Filter policy map incorporates other types of maps. To create the policy map, you will need one or more of these other types of maps:

- Parameter maps – On the Parameters tab of the Add and Edit Web Filter Map dialog boxes, you can select parameter maps for the various types of Web filtering if you do not want to use the default settings. If you are using SmartFilter (N2H2) or Websense, you need to select a parameter map because the map identifies those servers. For Local and Trend Micro filtering, parameter maps configure some general settings, the most interesting of which is whether to display a message or Web page when a URL is blocked. In the Policy Object Manager, you can find parameter maps for Local, N2H2, Trend, and Websense in the **Maps > Parameter Maps > Web Filter** folder. For detailed usage information, see [Configuring Local Web Filter Parameter Maps, page 21-37](#), [Configuring N2H2 or WebSense Parameter Maps, page 21-38](#), or [Configuring Trend Parameter Maps, page 21-41](#).

---

**Note** You configure Trend Micro server information on the Content Filtering tab of the Zone Based Firewall page (select Firewall > Settings > Zone Based Firewall). See [Zone Based Firewall Page, page 21-49](#).

---

- Class maps for match conditions – These class maps define the type of traffic you want to target and specify the action to be taken. You select a type of filtering (Local, SmartFilter/N2H2, Websense, or Trend Micro), specify the class map that identifies the targeted traffic, and choose an action (such as Allow, Reset, etc.) to be taken for that traffic. In the Policy Object Manager, you can find class maps for Local, N2H2, Trend, and Websense in the **Maps > Class Maps > Web Filter** folder.

These class-map configurations depend on the type of filtering:

**Local Filtering** – The Local WebFilter class map is a list of one or more URLF Glob parameter maps that specify either domain names or URL keywords that you want to target. A URL keyword is any text string delineated by forward-slash (/) characters in a URL. These class maps help you define allowed (whitelisted) and denied (blacklisted) URL lists for a WebFilter policy—create separate maps for each list. For detailed usage information, see [Configuring](#)

[Class Maps for Zone-Based Firewall Policies, page 21-17](#), [Local Web Filter Class Add or Edit Match Criterion Dialog Boxes, page 21-28](#), and [Configuring URLF Glob Parameter Maps, page 21-44](#).

**SmartFilter (N2H2) or Websense Filtering**—The class maps for N2H2 and Websense define any server response as the matching criterion. For detailed usage information, see [Configuring Class Maps for Zone-Based Firewall Policies, page 21-17](#).

**Trend Micro Filtering** – The Trend class map lets you select various Productivity Categories and Security Ratings, as defined by Trend Micro, that you want to target. For detailed usage information, see [Configuring Class Maps for Zone-Based Firewall Policies, page 21-17](#).

Besides the maps used to define content filtering, you can also configure the following maps for content filter rules:

- Inspect Parameters maps – Zone-based firewall inspection includes several general settings, all of which have default values that are appropriate for most networks. If you want to adjust any of these settings, you can create an Inspect Parameters map. In the Policy Object Manager, select **Maps > Parameter Maps > Inspect > Inspect Parameters**, and review the detailed usage information in [Configuring Inspect Parameter Maps, page 21-29](#).
- HTTP policy map – If you want to use deep inspection on the individual HTTP packets in addition to Web filtering, you can configure an HTTP policy map by clicking **Configure** next to the Protocol field in the Action section of the [Adding and Editing Zone-based Firewall Rules, page 21-59](#). The HTTP policy map incorporates HTTP class maps that define the type of traffic you want to match and then defines the action to take. For example, you can target traffic that includes Java applets. In the Policy Object Manager, select **Maps > Policy Maps > Inspect > HTTP (Zone Based IOS)**, and review the detailed usage information in [Configuring Policy Maps for Zone-Based Firewall Policies, page 21-33](#), [HTTP \(IOS\) Class Add or Edit Match Criterion Dialog Boxes, page 21-21](#), and [Configuring Class Maps for Zone-Based Firewall Policies, page 21-17](#).

## Configuring Local Web Filter Parameter Maps

Use the Add and Edit Local Parameter Map dialog boxes to define a parameter map for local web filtering for zone-based firewall policies on routers. If you configure the action of a zone-based firewall policy rule as Content Filter, you can select a Web Filter policy map that incorporates a Local web filter parameter map (when you select Local for the parameter type on the Parameter tab). For more information about Web Filter policy maps, see [Configuring Web Filter Maps, page 21-46](#).

#### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Parameter Maps > Web Filter > Local** in the table of contents. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                            | The name of the policy object. A maximum of 40 characters is allowed.                                                                                                                                                                                                                                                                                                                                                         |
| Description                     | A description of the policy object. A maximum of 200 characters is allowed.                                                                                                                                                                                                                                                                                                                                                   |
| Enable Alert                    | Whether to generate stateful packet inspection alert messages on the console.                                                                                                                                                                                                                                                                                                                                                 |
| Enable Allow Mode               | Whether to allow or block URL requests when the URL filtering process does not have connectivity to a URL filtering database. When allow-mode is on, all unmatched URL requests are allowed; when off, all unmatched URL requests are blocked.                                                                                                                                                                                |
| Block Page                      | The web page you want to present to the user if the user attempts to access a page that you block. You can select from the following: <ul style="list-style-type: none"> <li>• None—The user is not presented with any information.</li> <li>• Message—The user is presented with the text message you enter in the edit box.</li> <li>• Redirect URL—The user is redirected to the URL you enter in the edit box.</li> </ul> |
| Category                        | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-12</a> .                                                                                                                                                                                                                                                                     |
| Allow Value Override per Device | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-17</a> .                                                                                                                                                        |
| Overrides                       |                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Edit button                     | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                                                                                                                                                                                  |

## Configuring N2H2 or WebSense Parameter Maps

Use the Add and Edit N2H2 or Websense Parameter Map dialog boxes to define a parameter map for Smartfilter (N2H2) or Websense web filtering for zone-based firewall policies on routers. If you configure the action of a zone-based firewall policy rule as Content Filter, you can select a Web Filter policy map that incorporates an N2H2 or Websense web filter parameter map (when you select N2H2 or Websense for the parameter type on the Parameter tab). For more information about Web Filter policy maps, see [Configuring Web Filter Maps, page 21-46](#).

### Navigation Path

Select **Manage > Policy Objects**, then select N2H2 or WebSense from the **Maps > Parameter Maps > Web Filter** folder in the table of contents. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

| Element                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                       | The name of the policy object. A maximum of 40 characters is allowed.                                                                                                                                                                                                                                                                                                                                                         |
| Description                | A description of the policy object. A maximum of 200 characters is allowed.                                                                                                                                                                                                                                                                                                                                                   |
| URL Filtering Server Table | The list of URL filtering servers and their attributes. <ul style="list-style-type: none"> <li>• To add servers, click the Add button and fill in the Add External Filter dialog box (see <a href="#">Add or Edit External Filter Dialog Box, page 21-40</a>).</li> <li>• To edit a server, select it and click the Edit button.</li> <li>• To delete a server, select it and click the Delete button.</li> </ul>             |
| Enable Alert               | Whether to generate stateful packet inspection alert messages on the console.                                                                                                                                                                                                                                                                                                                                                 |
| Enable Allow Mode          | Whether to allow or block URL requests when the URL filtering process does not have connectivity to a URL filtering database. When allow-mode is on, all unmatched URL requests are allowed; when off, all unmatched URL requests are blocked.                                                                                                                                                                                |
| Block Page                 | The web page you want to present to the user if the user attempts to access a page that you block. You can select from the following: <ul style="list-style-type: none"> <li>• None—The user is not presented with any information.</li> <li>• Message—The user is presented with the text message you enter in the edit box.</li> <li>• Redirect URL—The user is redirected to the URL you enter in the edit box.</li> </ul> |
| Source Interface           | The interface whose IP address should be used as the source IP address when a TCP connection is established between the system and the URL filtering server.                                                                                                                                                                                                                                                                  |
| Maximum Cache Entries      | The maximum number of entries to store in the categorization cache. The default is 5000.                                                                                                                                                                                                                                                                                                                                      |
| Cache Life Time            | How long, in hours, an entry remains in the cache table. The default is 24.                                                                                                                                                                                                                                                                                                                                                   |
| Maximum Requests           | The maximum number of pending requests. The range is from 1 to 2147483647. The default is 1000.                                                                                                                                                                                                                                                                                                                               |
| Maximum Responses          | The maximum number of HTTP responses that can be buffered. The range is from 0 and 20000. The default is 200.                                                                                                                                                                                                                                                                                                                 |

## Add or Edit External Filter Dialog Box

Use the Add or Edit External Filter dialog box to add a URL filtering server to an N2H2, Websense, or URL Filter parameter map policy object.

### Navigation Path

Click the **Add** button beneath the server table, or select a server and click the **Edit** button, from any of the following dialog boxes:

- Add or Edit N2H2 or WebSense Parameter Map dialog boxes. See [Configuring N2H2 or WebSense Parameter Maps, page 21-38](#).
- Add or Edit URL Filter Parameter Map dialog boxes. See [Configuring URL Filter Parameter Maps, page 21-42](#).

### Field Reference

**Table 21-15** Add or Edit External Filter Dialog Box

| Element              | Description                                                                                                                               |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| Server               | The fully-qualified domain name or IP address of the URL filtering server.                                                                |
| Port                 | The port that is listening for requests.                                                                                                  |
| Retransmission Count | The number of times the router retransmits the lookup request when a response is not received from the server. The range is from 1 to 10. |

**Table 21-15 Add or Edit External Filter Dialog Box (Continued)**

| Element | Description                                                                                             |
|---------|---------------------------------------------------------------------------------------------------------|
| Timeout | The number of seconds that the router waits for a response from the server. The range is from 1 to 300. |
| Outside | Whether the server is outside the network.                                                              |

## Configuring Trend Parameter Maps

Use the Add and Edit Trend Parameter Map dialog boxes to define a parameter map for Trend Micro web filtering for zone-based firewall policies on routers. If you configure the action of a zone-based firewall policy rule as Content Filter, you can select a Web Filter policy map that incorporates a Trend web filter parameter map (when you select Trend for the parameter type on the Parameter tab). For more information about Web Filter policy maps, see [Configuring Web Filter Maps, page 21-46](#).

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Parameter Maps > Web Filter > Trend** in the table of contents. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name              | The name of the policy object. A maximum of 40 characters is allowed.                                                                                                                                                                                                                                                                                                                                                         |
| Description       | A description of the policy object. A maximum of 200 characters is allowed.                                                                                                                                                                                                                                                                                                                                                   |
| Enable Allow Mode | Whether to allow or block URL requests when the URL filtering process does not have connectivity to a URL filtering database. When allow-mode is on, all unmatched URL requests are allowed; when off, all unmatched URL requests are blocked.                                                                                                                                                                                |
| Block Page        | The web page you want to present to the user if the user attempts to access a page that you block. You can select from the following: <ul style="list-style-type: none"> <li>• None—The user is not presented with any information.</li> <li>• Message—The user is presented with the text message you enter in the edit box.</li> <li>• Redirect URL—The user is redirected to the URL you enter in the edit box.</li> </ul> |
| Maximum Requests  | The maximum number of pending requests. The range is from 1 to 2147483647. The default is 1000.                                                                                                                                                                                                                                                                                                                               |

**Table 21-16 Add or Edit Trend Parameter Map Dialog Boxes (Continued)**

| Element                         | Description                                                                                                                                                                                                                                                            |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maximum Responses               | The maximum number of HTTP responses that can be buffered. The range is from 0 and 20000. The default is 200.                                                                                                                                                          |
| Truncate Hostname               | Whether to truncate URLs at the end of the domain name.                                                                                                                                                                                                                |
| Category                        | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-12</a> .                                                                                                              |
| Allow Value Override per Device | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-17</a> . |
| Overrides                       |                                                                                                                                                                                                                                                                        |
| Edit button                     | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                           |

## Configuring URL Filter Parameter Maps

Use the Add and Edit URL Filter Parameter Map dialog boxes to define the parameters and match criterion and values for an inspection map used in a zone-based firewall policy for a router.

If you configure the action of a zone-based firewall policy rule as Content Filter, you can select a URL Filter parameter map to define web filtering parameters and match criteria. However, if the router is running Cisco IOS Software release 12.4(20)T or higher, the recommended approach is to configure a Web Filter policy map along with parameter and class maps for the appropriate server type (local, N2H2, Trend, or Websense). For more information, see [Configuring Web Filter Maps, page 21-46](#).

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Parameter Maps > Web Filter > URL Filter** in the table of contents. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

| Truncate Hostname<br>Truncate Script Parameters             | <p>Whether to truncate the URLs:</p> <ul style="list-style-type: none"> <li>If you do not select an option, URLs are not truncated.</li> <li>If you select Hostname, URLs are truncated at the end of the domain name.</li> <li>If you select Script Parameters, URLs are truncated at the left-most question mark in the URL.</li> </ul> <p>Do not select any truncate options for devices running software releases lower than 12.4(15)T or you will receive a validation error.</p> <p><b>Tip</b> Although you can select both options, it is illogical to do so.</p> |
| Enable Server Log                                           | Whether to send information about HTTP requests to the URL filtering server's log server. The information includes the URL, the hostname, the source IP address, and the destination IP address.                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Additional Fields</b>                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Category                                                    | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-12</a> .                                                                                                                                                                                                                                                                                                                                                                                                                |
| Allow Value Override per Device<br>Overrides<br>Edit button | <p>Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-17</a>.</p> <p>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.</p>                                                                         |

## Add or Edit URL Domain Name Dialog Box for URL Filter Parameters

Use the Add URL Domain Name dialog box to add web site domain names to the whitelisted (allowed) or blacklisted (not allowed) lists.

Domain names can be complete (including the host name, such as www.cisco.com), or partial (such as cisco.com). For partial names, all web site hosts on that domain are either permitted or denied. You can also enter host IP addresses.

### Navigation Path

From the Add or Edit URL Filter Parameter Map dialog boxes, click the **Add** button beneath the whitelist or blacklist tables, or select a name and click the **Edit** button. See [Configuring URL Filter Parameter Maps, page 21-42](#).

## Configuring URLF Glob Parameter Maps

Use the Add and Edit URLF Glob Parameter Map dialog boxes to define a parameter map for the inspection of URLs in a Local web filter class map.

A single URLF Glob should contain only segments of URLs that you want to block or allow. Your goal is to create class maps of white listed (allowed) or blacklisted (blocked) URLs. You can then define Local web filter policy maps to allow or block the identified URLs.

A single URLF Glob must also be limited to one of these types of URL segments:

- Strings that appear in the server name of a URL, which includes the name of the server and the domain name of the network. For example, `www.cisco.com`.
- Strings that appear in URL keywords, which are the strings that appear between / characters in a URL, or which are the file names. For example, in the URL segment `www.cisco.com/en/US/`, both `en` and `US` are keywords. The file name in a URL, such as `index.html`, is also considered a keyword.

You cannot use the characters `/`, `{`, `}`, and `?` in a URLF glob.

To match a server name or URL keyword, the string in the URL must match exactly the string included in the URLF glob unless you use wildcard metacharacters to specify a variable string pattern. You can use the following metacharacters for pattern matching for either server names or URL keywords:

- `*` (Asterisk). Matches any sequence of zero or more characters. For example, `*.edu` matches all servers in the education domain, and you could use `hack*` to block `www.example.com/hacksite/123.html`.
- `[abc]` (Character class). Matches any character in the brackets. The character matching is case sensitive. For example, `[abc]` matches `a`, `b`, or `c`, but not `A`, `B`, or `C`. Thus, you could use `www.[ey]xample.com` to block both `www.example.com` and `www.yxample.com`.
- `[a-c]` (Character range class). Matches any character in the range. The character matching is case sensitive. `[a-z]` matches any lowercase letter. You can mix characters and ranges; for example, `[abcq-z]` matches `a`, `b`, `c`, `q`, `r`, `s`, `t`, `u`, `v`, `w`, `x`, `y`, `z`, and so does `[a-cq-z]`. The dash (`-`) character is literal only if it is the last or the first character within the brackets, `[abc-]` or `[-abc]`.
- `[0-9]` (Numerical range class). Matches any number in the brackets. For example `[0-9]` matches `0`, `1`, `2`, `3`, `4`, `5`, `6`, `7`, `8`, or `9`. Thus, you can use `www.example[0-9][0-9].com` to block `www.example01.com`, `www.example33.com`, and `www.example99.com` (and so forth).

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Parameter Maps > Web Filter > URLF Glob Parameters** in the table of contents. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

| Overrides                       |                                                                                                                                                                                                                                                                                                                                                                           |
| Edit button                     | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                                                                                                                              |

## Configuring Web Filter Maps

Use the Add and Edit Web Filter Map dialog boxes to define the parameters and match criterion and values for an inspection map used in a zone-based firewall policy for a router.

If you configure the action of a zone-based firewall policy rule as Content Filter, you can select a Web Filter policy map to define web filtering parameters and match criteria. You can select Web Filter policy maps only for routers running Cisco IOS Software release 12.4(20)T and higher. If you are configuring zone-based firewalls for routers running Cisco IOS Software release 12.4(6)T up to 12.4(20)T, you must configure a URL Filter parameter map instead of a Web Filter policy map. For more information, see [Configuring URL Filter Parameter Maps, page 21-42](#).

You can configure a mix of local and server-based web filtering. To do this, you should select a parameter map appropriate for the type of server you are using, and for the match criteria, an appropriate mix of local and server class maps. Do not mix class and parameter maps for different types of servers.

### Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Web Filter > Web Filter** from the Object Type selector. Right-click inside the table and select **New Object** or right-click a row and select **Edit Object**.

| Category                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , page 6-12.                                                                                                               |
| Allow Value Override per Device                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , page 6-18 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , page 6-17. |
| Overrides                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                                                                                         |
| Edit button                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                            |

## Changing the Default Drop Behavior

By default, all traffic between zones is dropped unless explicitly allowed. However, you can change this default behavior, as described in this section.

Security Manager converts the parameters—including class, parameter, and policy maps—that you supply for zone-based firewall rules into a series of IOS commands that the router will recognize. These are the so-called "CLI" (command line interface) configuration commands, which you can preview in separate window by choosing Tools > Preview Configuration. See [Previewing Configurations](#), page 8-45 for more information. In addition, the section, [Troubleshooting Zone-based Rules and Configurations](#), page 21-53, discusses an example of zone-based firewall CLI commands.

For the purposes of this discussion, the most interesting of these commands is **policy-map**, which is used to apply your zone policy for each pair of zones. That is, for any given zone-pair, all rules defining traffic (classes) and actions are applied within one policy-map. Further, Security Manager appends the current **class-default** class to the end of each policy-map's class list to capture any packets not processed by a zone rule.

The default class-default is drop—appending this class to each policy-map is how the implicit dropping of traffic between zones is accomplished. However, as mentioned, you can change this default behavior for any zone-pair. For example, you might elect to pass all unmatched traffic, or you might change the default to drop and log so you can determine what traffic is not being matched by your existing rules.

**Note**

---

The only options for the default behavior are Drop, Drop and Log, Pass, and Pass and Log.

---

If you want the default policy to continue to drop packets, you do not have to do anything in Security Manager. This rule is generated automatically. If you do want to change the default behavior for a zone-pair, you must provide a **Permit any any IP** rule (that is, Match: Permit; Sources: any; Destinations: any; Services: IP in the [Adding and Editing Zone-based Firewall Rules, page 21-59](#)), with **Drop and Log, Pass, or Pass and Log** as the chosen Action. You must also ensure that this rule appears last in the list of rules for a zone pair. Security Manager interprets this as the intended class-default rule.

If your zone-based rules table includes a large number of rules, it might be difficult to ensure that this rule comes after all other rules for a zone pair. Here are a couple of techniques you can use to alleviate this:

- Use sections to organize the table, with one section per zone-pair. This will make it easier for you to order the rules for a zone-pair, as well as ensuring that the class-default rule comes last. For more information on working with sections, see [Using Sections to Organize Rules Tables, page 12-20](#).
- Create a shared zone-based rules policy that includes the class-default rule in the Default scope, and inherit this rule in the device's local zone-based rule policy. For more information on inheritance and creating shared policies, see [Inheriting or Uninheriting Rules, page 5-43](#) and [Creating a New Shared Policy, page 5-51](#).

## Configuring Settings for Zone-based Firewall Rules

Use the Zone Based Firewall settings page to: identify unreferenced zones; specify a zone for VPN interfaces; enable or disable WAAS support; maintain Trend Micro server and certificate information; and specify global Log settings on supported ASR devices.

### Related Topics

- [Zone Based Firewall Page, page 21-49](#)
- [Understanding the Zone-based Firewall Rules, page 21-3](#)

---

**Step 1** Access the [Zone Based Firewall Page, page 21-49](#) as follows:

- (Device view) Select an IOS device and then select **Firewall > Settings > Zone Based Firewall** from the Policy selector.
- (Policy view) Select **Firewall > Settings > Zone Based Firewall** from the Policy Type selector. Select an existing policy or create a new one.

**Step 2** (Optional) On the Zones tab: add, edit and delete unreferenced zones.

The Zones tab lists all unreferenced zones defined on the device; that is, zones without any associated interfaces, rules or policies. Unreferenced zones are usually found and listed during device discovery, but you also can create named, “empty” zones here.

**Step 3** (Optional) On the VPN tab, supply the name of the zone specifically set up for VPN traffic.

This zone ensures that dynamic VPN traffic can be processed by the zone-based firewall rules on this router. See [Using VPNs with Zone-based Firewall Policies, page 21-5](#) for more information.

**Step 4** (Optional) On the WAAS tab, select Enable WAAS to enable Wide Area Application Services interoperability.

If this option is not enabled, packets being optimized by a WAAS device may be dropped because WAAS increases the TCP packet sequence number during the TCP handshake. This behavior may be viewed as a possible attack by the IOS device.

**Step 5** (Optional) On the Content Filter Settings tab, provide server settings for Trend Micro-based content filtering.

To use Trend Micro-based content filtering, you must configure contact information for the Trend Micro server on this tab of the Zone Based Firewall page. This tab also provides links to Trend Micro registration and certificate download. You must have an active subscription with Trend Micro to utilize this form of content filtering, and you must download and install a valid subscription certificate on this IOS device.

For more information, see [Zone Based Firewall Page - Content Filter Tab, page 21-51](#).

**Step 6** (Optional) On the Global Parameters (ASR) tab, you can configure global, logging-related settings specific to ASR devices:

- Log Dropped Packets – Select this option to log all packets dropped by the device; syslog logging must be enabled to view the information.
- Log Flow export timeout rate – NetFlow logs are created after a flow either expires or is timed out, and it is important to put a time limit on how long a flow can be active before expiring. This value is maximum number of minutes a flow can remain active before it is expired. The value can be any integer from 1 to 3600; the default is 30.
- Log Flow export destination IP – The IP address or host name of the NetFlow collector to which flow data is to be sent.
- Log Flow export destination port – The UDP port monitored by the NetFlow collector for flow data.

## Zone Based Firewall Page

Use the Zone Based Firewall page to configure and identify unreferenced zones, specify a VPN zone, enable or disable WAAS support, maintain Trend Micro server and certificate information, and specify global Log settings on supported ASR devices.

The following tabs are described in the table on this page:

- **Zones**
- **VPN**
- **WAAS**
- **Global Parameters (ASR)**

The **Content Filtering** tab is detailed in [Zone Based Firewall Page - Content Filter Tab, page 21-51](#).

**Navigation Path**

To access the Zone Based Firewall page, do one of the following:

- (Device view) Select a device, then select **Firewall > Settings > Zone Based Firewall** from the Policy selector.
- (Policy view) Select **Firewall > Settings > Zone Based Firewall** from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click a device and choose **Edit Firewall Settings > Zone Based Firewall**.

| Global Parameters (ASR) tab | <p>This tab displays global, logging-related settings specific to ASR devices. Configure these settings as follows:</p> <ul style="list-style-type: none"> <li>• Log Dropped Packets – Select this option to log all packets dropped by the device; syslog logging must be enabled to view the information.</li> <li>• Log Flow export timeout rate – NetFlow logs are created after a flow either expires or is timed out, and it is important to put a time limit on how long a flow can be active before expiring. This value is maximum number of minutes a flow can remain active before it is expired. The value can be any integer from 1 to 3600; the default is 30.</li> <li>• Log Flow export destination IP – The IP address or host name of the NetFlow collector to which flow data is to be sent.</li> <li>• Log Flow export destination port – The UDP port monitored by the NetFlow collector for flow data.</li> </ul> |

## Zone Based Firewall Page - Content Filter Tab

To use Trend Micro-based content filtering, you must configure contact information for the Trend Micro server on this tab of the Zone Based Firewall page. This tab also provides links to Trend Micro registration and certificate download. You must have an active subscription with Trend Micro to utilize this form of content filtering, and you must download and install a valid subscription certificate on this IOS device.

### Navigation Path

To access the Zone Based Firewall page, do one of the following:

- (Device view) Select a device, then select **Firewall > Settings > Zone Based Firewall** from the Device selector.
- (Policy view) Select **Firewall > Settings > Zone Based Firewall** from the Policy selector.
- (Map view) Right-click a device and choose **Edit Firewall Settings > Zone Based Firewall**.

| Element                                              | Description                                                                                                                                                            |
|------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Trend Micro Server Settings</b>                   |                                                                                                                                                                        |
| Cache-entry-lifetime (hrs)                           | How long, in hours, a look-up request to the Trend Micro server remains in the router's local URL cache table. The allowed range is 0 to 120; the default value is 24. |
| Cache-size (KBytes)                                  | The maximum amount of memory to be used by the router's local URL cache. The allowed range is 0 to 120,000 KB; the default value is 250.                               |
| Server                                               | The fully-qualified domain name or IP address of the Trend Micro URL filtering server.                                                                                 |
| HTTP Port                                            | The port the Trend Micro server is listening to for HTTP requests. The default is 80.                                                                                  |
| HTTPS Port                                           | The port the Trend Micro server is listening to for HTTPS requests. The default is 443.                                                                                |
| Retransmission Count                                 | The number of times the router retransmits a look-up request when a response is not received from the server. The range is 1 to 10.                                    |
| Retransmission Timeout                               | The number of seconds that the router waits for a response from the server. The range is 1 to 300.                                                                     |
| Alert                                                | Whether stateful packet inspection messages are copied to the syslog.                                                                                                  |
| <b>Trend Micro Server Certificate Download Links</b> |                                                                                                                                                                        |
| Link to download certificates                        | Opens the page for installing Trusted Authority Certificates on Cisco IOS Routers for Trend URL Filtering Support.                                                     |
| Link for product registration                        | Opens the page for Product License Registration. You must enter the Product Authorization Key and register the router.                                                 |

**Zone Dialog Box**

Use the Add and Edit Zone dialog boxes to add and edit unreferenced zones—zones without any associated interfaces, rules or policies.

**Navigation Path**

To access the Add and Edit Zone dialog boxes, do one of the following:

- (Device view) Select a device, then select **Firewall > Settings > Zone Based Firewall** from the Device selector. Right-click inside the Zones table, then select **Add Row**, or right-click a line item, then select **Edit Row**.
- (Policy view) Select **Firewall > Settings > Zone Based Firewall** from the Policy selector. Right-click inside the table, then select **Add Row**, or right-click a line item, then select **Edit Row**.
- (Map view) Right-click a device and select **Edit Firewall Policies > Settings > Zone Based Firewall Rules**.

Enter a zone name in the Zone field, or click **Select** to choose one from the Interfaces Selector dialog box.

## Troubleshooting Zone-based Rules and Configurations

Zone-based firewall rules are powerful, but also complex. Using zone rules, you can replace access rules, inspection rules, and Web filter rules with a single type of firewall rule. Because zone-based firewall rules can perform so many possible actions, the configuration generated from them uses many different types of configuration commands, including structures for access control lists (ACLs), class maps, and policy maps. There is no one-to-one correspondence between a zone-based firewall rule and a line in the configuration (unlike access rules, for example).

To illustrate this complexity, this topic describes the relationship between zone-based firewall rules and the configuration generated from them. You do not need to know any of the information in this topic to create and deploy zone-based firewall rules. However, if you are familiar with the CLI (command line interface), or if you find that your rules are generating undesired results, this information can help you understand and troubleshoot zone-based firewall rules.

Consider the set of rules shown in the following illustration. These rules form a policy for a single zone pair, affecting traffic moving from the Inside zone to the Outside zone. This is traffic from your internal network going to the Internet. The rules define the following actions:

- Drop all traffic from the 10.100.10.0/24 and 10.100.11.0/24 networks.
- Drop all FTP and FTPS traffic from the 10.100.12.0/24 network.
- Drop all peer-to-peer traffic from any network.
- Inspect (and allow) all FTP/FTPS traffic (except for that from 10.100.12.0/24, which is already dropped).
- Inspect all HTTP traffic using an additional deep-inspection policy map.
- And finally, perform generic inspection of all remaining TCP/UDP traffic.

**Figure 21-3** Example of Zone-based Rules for a Zone Pair

| No.                         | Permit | Source         | Destination | Service | From Zone | To Zone | Inspected Protocol                                  | Action  |
|-----------------------------|--------|----------------|-------------|---------|-----------|---------|-----------------------------------------------------|---------|
| Local - Mandatory (7 Rules) |        |                |             |         |           |         |                                                     |         |
| 1                           | ✓      | 10.100.10.0/24 | any         | IP      | Inside    | Outside |                                                     | Drop    |
| 2                           | ✓      | 10.100.11.0/24 | any         | IP      | Inside    | Outside |                                                     | Drop    |
| 3                           | ✓      | 10.100.12.0/24 | any         | IP      | Inside    | Outside | Ftp<br>Ftps                                         | Drop    |
| 4                           | ✓      | any            | any         | IP      | Inside    | Outside | Bittorrent<br>Edonkey<br>Fasttrack<br>Icq<br>Kazaa2 | Drop    |
| 5                           | ✓      | any            | any         | IP      | Inside    | Outside | Ftp<br>Ftps                                         | Inspect |
| 6                           | ✓      | any            | any         | IP      | Inside    | Outside | Http(HTTPpmap)                                      | Inspect |
| 7                           | ✓      | any            | any         | IP      | Inside    | Outside | Tcp<br>Udp                                          | Inspect |

When you deploy these rules, Security Manager generates the following configuration. The bold letters are added for reference in the explanation that follows the configuration.

**A.**

```

```

!

The following list explains how the rules in Security Manager are converted to device-configuration commands, to aid your understanding of the relationship between the two. The list numbering corresponds to the rule numbers from the rules table in Security Manager (see the previous illustration):

1. This rule drops all traffic from the 10.100.10.0/24 network. The Permit, Source, Destination, and Service fields are used to create the first access control entry (ACE) in the ACL named CSM\_ZBF\_CMAP\_ACL\_1 defined in (K). This ACL is referenced from the class map CSM\_ZBF\_CLASS\_MAP\_1 defined in (C), which then defines the first drop rule in the policy map CSM\_ZBF\_POLICY\_MAP\_1, defined in (I).

The policy map (I) is used to define the zone service policy in (J). Because this policy map is how all of the rules are assigned to the zone pair, (J) is not mentioned again.

2. This rule drops all traffic from the 10.100.11.0/24 network. This rule is combined with rule 1 by adding an ACE to the ACL defined in (K). The rest of the configuration is identical to rule 1. Thus, rules 1 and 2 essentially become a single rule in the device configuration.
3. This rule drops all FTP/FTPS traffic from the 10.100.10.12/24 network. The Permit, Source, Destination, and Service fields are used to create the ACL named CSM\_ZBF\_CMAP\_ACL\_2 defined in (L). The Protocol table generates the class map CSM\_ZBF\_CMAP\_PLMAP\_1 defined in (D), which specifies the FTP and FTPS protocols. The ACL and FTP/FTPS class map are then used in a new class map, CSM\_ZBF\_CLASS\_MAP\_2 defined in (E), which completes the characterization of the traffic based on the combination of source and protocol. Finally, (E) is referenced in the policy map (I) as the second rule.
4. This rule drops peer-to-peer traffic from any source that uses any of these protocols: Bittorrent, eDonkey, FastTrack, ICQ, or Kazaa2. This rule prevents any of your internal servers from being used as a file-sharing source for these services. Because the rule applies to all sources and destinations for the default IP service, no ACL is required. Instead, the configuration starts with the class map CSM\_ZBF\_CLASS\_MAP\_3 defined in (F). This class map is referenced by the third drop rule in the policy map (I).
5. This rule inspects FTP/FTPS traffic from any source to any destination, which means these services are allowed. Note that rule 3, because it comes above rule 5, already drops FTP/FTPS traffic from the 10.100.12.0/24 network, so the combination of these rules means that FTP/FTPS traffic is inspected for all sources except 10.100.12.0/24. Because the Protocol table specifies the same protocols as it does for rule 3, no new class map is needed. Instead, the policy map (I) simply refers to the class map (D) as the fourth class type, but this time with the Inspect action.
6. This rule inspects HTTP traffic and applies a deep-inspection policy map named HTTPpmap. The HTTPpmap policy map (B) defines the action to take when traffic matches the criteria defined in the class map HTTPcmap (A). These maps specify that any HTTP connection that violates the HTTP protocol, or that misuses ports, should be reset (dropped) and a syslog entry generated. (Protocol violation and port misuse can characterize Denial of Service attacks.) The combination of (A) and (B) define the deep-inspection rules for this policy.

An additional class map, CSM\_ZBF\_CLASS\_MAP\_4, is needed to specify the HTTP protocol (G). Then, the fifth class type rule in the policy map (I) refers to class map (G) for inspection, and the service-policy command refers to the policy map (B) for deep inspection.

7. This rule provides generic inspection on TCP/UDP traffic, allowing and inspecting the remaining TCP/UDP traffic from the internal network to the Internet and back. The class map CSM\_ZBF\_CLASS\_MAP\_5 defined in (H) is generated from the Protocols table. This class map then becomes the next-to-last rule in the policy map (I).

8. Finally, there is an automatic rule, which appears as the final class-default rule in the policy map (I). This rule drops any traffic that does not match one of the class maps referenced in the policy map (I). For example, ICMP traffic from the internal network to the Internet will not be allowed. For information on configuring a different class-default rule, see [Changing the Default Drop Behavior, page 21-47](#).

## Zone-based Firewall Rules Page

Zone-based firewall rules provide unidirectional application of firewall policies between groups of interfaces known as “zones.” That is, interfaces are assigned to zones, and specific inspection policies are applied to traffic moving between zones in one direction or the other.

A zone defines a boundary where traffic is subjected to specific restrictions as it crosses into another region of your network. The default zone-based firewall policy between zones is **deny all**. Thus, if no policy is explicitly configured, all traffic between zones is blocked.

### Note

Zone-based firewall policies can be configured only on Cisco IOS and ASR devices.

The Zone Based Firewall Rules page displays a list of currently configured zone-based firewall rules, and lets you add, edit and delete rules.

### Tip

Disabled rules are shown with hash marks covering the table row. When you deploy the configuration, disabled rules are removed from the device. For more information, see [Enabling and Disabling Rules, page 12-20](#).

### Navigation Path

To access the Zone Based Firewall Rules page, do one of the following:

- (Device view) Select a device, then select **Firewall > Zone Based Firewall Rules** from the Policy selector.
- (Policy view) Select **Firewall > Zone Based Firewall Rules** from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click a device and select **Edit Firewall Policies > Zone Based Firewall Rules**.

| Element | Description                                                                                                                                                     |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.     | This number indicates the rule's position in the ordering of the list. You can use the Up Row and Down Row buttons to change the position of the selected rule. |

Table 21-22 Zone Based Firewall Rules Page (Continued)

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Permit             | Indicates whether the rule permits or denies traffic. <ul style="list-style-type: none"> <li>Permit – Shown as a green check mark.</li> <li>Deny – Shown as a red circle with a slash.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Source             | Identifies source networks and hosts for this rule. Networks/hosts can be provided as named objects, or as IP addresses. See <a href="#">Understanding Networks/Hosts Objects, page 6-74</a> for more information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Destination        | Identifies destination networks and hosts for this rule. Networks and hosts can be provided as named objects, or as IP addresses. See <a href="#">Understanding Networks/Hosts Objects, page 6-74</a> for more information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Service            | The services that define the types of traffic matched by this rule. Services are defined by objects that specify protocol and port information. See <a href="#">Understanding and Specifying Services and Service and Port List Objects, page 6-86</a> for more information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| From Zone          | This rule applies only to traffic originating from this zone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| To Zone            | This rule applies only to traffic destined for this zone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Inspected Protocol | The protocol(s) on which the rule performs the chosen Action.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Action             | Identifies how matched protocols are processed: <ul style="list-style-type: none"> <li>Drop – Matched traffic is silently dropped. The default action for all traffic.</li> <li>Drop and Log – Matched traffic is logged and dropped.</li> <li>Pass – The router forwards matched traffic from the source zone to the destination zone.</li> <li>Pass and Log – Traffic is logged and forwarded.</li> <li>Inspect – State-based traffic control; Inspect can provide application inspection and control for certain protocols, based on Port to Application Mapping (PAM).</li> <li>Content Filter – HTTP content inspection based on a WebFilter parameter map, or a WebFilter policy map.</li> </ul> <p><b>Note</b> The Log options generate system-log messages; you must ensure that syslog logging is configured to capture these messages.</p> |
| Options            | The Inspect Parameter map assigned to this rule; available only with Inspect and Content Filter actions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Category           | The category assigned to the rule. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-12</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Description        | The description of this rule, if provided. A maximum of 1024 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Table 21-22** Zone Based Firewall Rules Page (Continued)

| Element                                   | Description                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Last Ticket(s)                            | Shows the ticket(s) associated with last modification to the rule. You can click the ticket ID in the Last Ticket(s) column to view details of the ticket and to navigate to the ticket. If linkage to an external ticket management system has been configured, you can also navigate to that system from the ticket details (see <a href="#">Ticket Management Page, page 11-51</a> ). |
| Tools button                              | Click this button to select tools that you can use with this type of policy. You can select the following tool: <ul style="list-style-type: none"> <li>Query – To run policy queries, which can help you evaluate your rules and identify ineffective rules that you can delete. See <a href="#">Generating Policy Query Reports, page 12-28</a></li> </ul>                              |
| Find and Replace button (binoculars icon) | Searches for values in rules tables, such as IP addresses and policy object names, to facilitate locating and making changes to rules in tables. See <a href="#">Finding and Replacing Items in Rules Tables, page 12-16</a> .                                                                                                                                                           |
| Up button                                 | Moves the selected rule up one row in the table.                                                                                                                                                                                                                                                                                                                                         |
| Down button                               | Moves the selected rule down one row in the table.                                                                                                                                                                                                                                                                                                                                       |
| Add button                                | Opens the Add Zone-based Firewall Rule dialog box, where you can create a new rule.                                                                                                                                                                                                                                                                                                      |
| Edit button                               | Used to edit the selected rule in the table; opens the Edit Zone-based Firewall Rule dialog box.                                                                                                                                                                                                                                                                                         |
| Delete button                             | Deletes the selected rule from the table.                                                                                                                                                                                                                                                                                                                                                |

## Adding and Editing Zone-based Firewall Rules

Use the Add and Edit Zone based Firewall Rule dialog boxes to add and edit zone-based firewall rules on Cisco IOS and ASR devices.

### Navigation Path

From the [Zone-based Firewall Rules Page, page 21-57](#), click the **Add Row** button, or select a row and click the **Edit Row** button.

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Traffic                 | Define the traffic flow to which this rule is applied.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Match                   | Choose whether to Permit or Deny matched traffic. See <a href="#">Understanding the Relationship Between Permit/Deny and Action in Zone-based Firewall Rules, page 21-7</a> for additional information about this option.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Sources<br>Destinations | <p>Provide the source networks/hosts and destination networks/hosts for matching traffic. Each field allows multiple entries separated by commas.</p> <p>You can enter any combination of the following address types to define the source or destination of the traffic. For more information, see <a href="#">Specifying IP Addresses During Policy Definition, page 6-81</a>.</p> <ul style="list-style-type: none"> <li>• Network/host object. Enter the name of the object, or click Select to select it from a list. You can also create new network/host objects in the selection dialog box.</li> <li>• Host IP address; for example, 10.10.10.100.</li> <li>• Network address, including subnet mask, in either 10.10.10.0/24 or 10.10.10.0/255.255.255.0 formats.</li> <li>• A range of IP addresses; for example, 10.10.10.100-10.10.10.200.</li> <li>• An IP address pattern in the format 10.10.0.10/255.255.0.255, where the mask is a discontinuous bit mask (see <a href="#">Contiguous and Discontinuous Network Masks for IPv4 Addresses, page 6-75</a>).</li> </ul> |
| Services                | <p>Specify the services that define the type of traffic to matched by this rule. You can enter any combination of service objects and service types (which are typically a protocol and port combination), separated by commas. See <a href="#">Understanding the Relationship Between Services and Protocols in Zone-based Firewall Rules, page 21-10</a> for additional information about this option.</p> <p>If you type in a service, you are prompted as you type with valid values. You also can click Select to select services from a list. For complete information on how to specify services, see <a href="#">Understanding and Specifying Services and Service and Port List Objects, page 6-86</a>.</p>                                                                                                                                                                                                                                                                                                                                                                   |
| From Zone<br>To Zone    | <p>Basic zone-based firewall rules are unidirectional; that is, they define a traffic flow that moves in only one direction between two zones.</p> <p>Enter or Select the zone from which traffic flows can originate for this rule, and enter or Select the zone to which traffic can flow.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Advanced button         | Opens the Advanced Options dialog box where you can select time-range options. See <a href="#">Zone-based Firewall Rule: Advanced Options Dialog Box, page 21-63</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Element                                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Action</b><br><br>Action: Drop, Drop and Log, Pass, Pass and Log | <p>The action applied to traffic that matches this rule. Choose the desired Action:</p> <ul style="list-style-type: none"> <li>• <b>Drop</b> – Silently drops all packets for the specified Services. The default action for all traffic.</li> <li>• <b>Drop and Log</b> – Matched traffic is logged and dropped.</li> <li>• <b>Pass</b> – The router forwards matched packets from the From Zone to the To Zone. Return traffic is not recognized, so you have to specify additional rules for return traffic. This option is useful only for protocols such as IPsec-encrypted traffic.</li> <li>• <b>Pass and Log</b> – Traffic is logged and forwarded.</li> </ul> <p>For any of these Actions, you can select one or more protocols to be matched by clicking the <b>Select</b> button next to the Protocol table to open the <a href="#">Protocol Selector Dialog Box, page 21-64</a>. However, this is not necessary; you can leave the Protocol table empty and pass or drop traffic based on the Sources, Destinations, and Services parameters; in effect, these are standard access rules.</p> <p>The Protocol Selector dialog box also provides access to the <a href="#">Configure Protocol Dialog Box, page 21-65</a>, where you can edit the Port Application Mapping (PAM) parameters for the selected protocol.</p> <p><b>Note</b> The Log options generate system-log messages; you must ensure that syslog logging is configured to capture these messages.</p> |

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action: Inspect | <p><b>Inspect</b> provides state-based traffic control—the device maintains connection or session information for TCP and UDP traffic, meaning return traffic in reply to connection requests is permitted.</p> <p>Choose this option to apply packet inspection based on your selected Layer 4 (TCP, UDP) and Layer 7 (HTTP, IMAP, instant messaging, and peer-to-peer) protocols. You also can edit PAM settings for the selected protocols, and you can set up deep packet inspection (DPI) and provide additional protocol-related information for the Layer 7 protocols. See <a href="#">Configuring Inspection Maps for Zone-based Firewall Policies</a>, page 21-15 for more information.</p> <ol style="list-style-type: none"> <li>1. You can select one or more protocols for inspection by clicking the <b>Select</b> button next to the Protocol table to open the <a href="#">Protocol Selector Dialog Box</a>, page 21-64.</li> <li>2. The Protocol Selector dialog box also provides access to the <a href="#">Configure Protocol Dialog Box</a>, page 21-65, where you can create custom protocols, and edit the PAM and DPI parameters for the selected protocol.</li> <li>3. <b>Inspect Parameters</b> – You can apply a customized set of connection, timeout, and other settings by entering the name of an Inspect Parameter map in this field, or you can click Select to select one from a list. You also can create new Inspect Parameter maps from the selection-list dialog box; see <a href="#">Configuring Inspect Parameter Maps</a>, page 21-29 for more information.</li> </ol> <p>If you do not specify an Inspect Parameters map, the default settings are used.</p> |

| Element                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action: Content Filter | <p><b>Content Filter</b> provides URL filtering based on a supplied parameter or policy map. The router intercepts HTTP requests, performs protocol-related inspection, and optionally contacts a third-party server to determine whether the requests should be allowed or blocked. You can provide a WebFilter parameter map, which defines filtering based on local URL lists, as well as information from an external SmartFilter (previously N2H2) or Websense server. Alternately, you can provide a WebFilter policy map that accesses Local, N2H2, Websense, or Trend Micro filtering data.</p> <ol style="list-style-type: none"> <li>1. When <b>Content Filter</b> is the chosen Action, HTTP is the specified Protocol. You can click Configure to open the <a href="#">Configure Protocol Dialog Box, page 21-65</a>, where you can edit the HTTP PAM settings, and apply an HTTP DPI map.</li> <li>2. Select <b>WebFilter Parameter Map</b>, or <b>WebFilter Policy Map</b>, and supply the name of an appropriate map. You can click the appropriate Select button to select the map from a list; you also can create new maps from the selection-list dialog box. See <a href="#">Configuring Content Filtering Maps for Zone-based Firewall Policies, page 21-35</a> for information about configuring these maps.</li> <li>3. <b>Inspect Parameters</b> – You can apply a customized set of connection, timeout, and other settings by entering the name of an Inspect Parameter map in this field, or you can click Select to select one from a list. You also can create new Inspect Parameter maps from the selection-list dialog box; see <a href="#">Configuring Inspect Parameter Maps, page 21-29</a> for more information.</li> </ol> <p>If you do not specify an Inspect Parameters map, the default settings are used.</p> |
| Description            | (Optional) You can enter a description of up to 1024 characters to help you identify the rule when viewing the rules table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Category               | (Optional) You can assign a category to the rule, to help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-12</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Zone-based Firewall Rule: Advanced Options Dialog Box

Use the Zone-Based Firewall Rule Advanced Options dialog box to apply specific time-range information to a zone-based firewall rule.

### Navigation Path

In the Traffic section of the Add or Edit Zone based Firewall Rule dialog box, click the **Advanced** button.

| Element    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Time Range | <p>This feature lets you define time periods during which this zone-based firewall rule is active. If you do not specify a time range, the rule is immediately and always active.</p> <p>Enter the name of a time-range object, or click <b>Select</b> to choose one from a list in the Time Ranges Selector dialog box. You can create and edit time-range objects from this dialog box. For more information, see <a href="#">Configuring Time Range Objects, page 6-66</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                             |
| Options    | <p>This feature lets you apply an initial-packet-fragment or an established-connection restriction to this zone-based firewall rule. Choose one of the following options:</p> <ul style="list-style-type: none"> <li>• <b>None</b>—No packet-fragment or established-connection restrictions are applied.</li> <li>• <b>Fragment</b> – If chosen, the rule is applied to non-initial packet fragments; the fragment is either permitted or denied accordingly. The white paper, “<a href="#">Access Control Lists and IP Fragments</a>,” provides additional information that is also relevant to zone-based firewall rules.</li> <li>• <b>Established</b> – For the TCP protocol only; requires an established connection. A match occurs if the TCP datagram has the ACK or RST control bits set. The non-matching case is that of the initial TCP datagram to form a connection.</li> </ul> |

## Protocol Selector Dialog Box

Use the Protocol Selector dialog box to specify one or more communication protocols as part of the definition of traffic for a zone-based firewall rule.

The Protocol Selector dialog box also provides access to the Configure Protocol dialog box, which you can use to create custom protocols and edit Port Application Mapping (PAM) parameters for existing protocols. The Configure Protocol dialog box is also where you select Deep Inspection policy maps, and Protocol Info parameter maps, for certain protocols. See [Configure Protocol Dialog Box, page 21-65](#) for more information.

**Navigation Path**

The Protocol Selector dialog box can be accessed from the Add and Edit Zone based Firewall Rule dialog boxes (described in [Adding and Editing Zone-based Firewall Rules, page 21-59](#)). In either dialog box, choose any Action except Content Filter and then click the Select button next to the Protocol table.

You can also open the Protocol Selector dialog box by right-clicking the Inspected Protocol column for any entry in the Zone Based Firewall Rules table, and then choosing Edit Protocols.

|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Available Protocols | A list of protocols that can be selected for a zone-based firewall rule.<br><b>Tip</b> You can create a custom protocol by clicking the Create button below the Selected Protocols column, opening the <a href="#">Configure Protocol Dialog Box, page 21-65</a> .                                                                             |
| Selected Protocols  | The list of protocols you have selected for this zone-based firewall rule.<br><b>Tip</b> You can edit Port Application Mapping (PAM) settings for the protocol highlighted in the Selected Protocols column: click the Edit button below the Selected Protocols column to open the <a href="#">Configure Protocol Dialog Box, page 21-65</a> . |
| >> button           | Moves the highlighted protocols from the Available Protocols column to the Selected Protocols column. You can select multiple protocols using the standard Shift-click and Ctrl+click functions.                                                                                                                                               |
| << button           | Moves the highlighted protocols from the Selected Protocols column back to the Available Protocols column. You can select multiple protocols using the standard Shift-click and Ctrl+click functions.                                                                                                                                          |

## Configure Protocol Dialog Box

Packet inspection can be configured in zone-based firewall rules by the selection of specific protocol objects, which define Port Application Mapping (PAM) parameters (Layer 4 protocols and ports, and optionally specific networks and hosts). A Layer 7 (HTTP, IMAP, Instant Messaging, and peer-to-peer) protocol can also include a deep-packet inspection policy specific to that protocol. Refer to [Adding and Editing Zone-based Firewall Rules, page 21-59](#) for information about selecting protocols during zone-based firewall rule definition.

The Configure Protocol dialog box is used to edit existing protocol definitions, and to create custom definitions, for use with zone-based firewall rules. For example, if a protocol does not use its default ports for some or all networks, you can configure different port mappings.

### Navigation Path

The Configure Protocol dialog box is accessed from the [Protocol Selector Dialog Box, page 21-64](#), as follows:

- Click the Create (+) button below the Selected Protocols list to create a new protocol.
- Select a protocol in the Selected Protocols list, and click the Edit (pencil) button to edit that protocol.

**Table 21-26** Configure Protocol Dialog Box

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocol Name                   | The name of the selected protocol. If you are creating a custom protocol, you can enter a name of up to 19 characters. Custom protocol names must begin with <b>user-</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Enable Signature                | <p>This option is available only when editing the peer-to-peer (eDonkey, FastTrack, Gnutella, Kazaa2) protocols.</p> <p>Enabling this option means Network-based Application Recognition (NBAR) heuristics will be applied to the traffic to detect “telldates” that signify specific P2P application activity. These telldates includes port-hopping and other changes in application behavior to avoid traffic detection.</p> <p><b>Note</b> This level of traffic inspection comes at the price of increased CPU utilization and reduced network throughput capability.</p>                                                                |
| Deep Inspection                 | <p>This option is available only when editing the H.323, HTTP, IM (AOL, ICQ, MSN Messenger, Windows Messenger, and Yahoo Messenger), IMAP, P2P (eDonkey, FastTrack, Gnutella, Kazaa2), POP3, SIP, SMTP, Sun RPC protocols, and <b>Inspect</b> is the chosen Action for the zone-based firewall rule.</p> <p>Enter or Select the name of the Inspect policy map to be used with the selected protocol. See <a href="#">Configuring Inspection Maps for Zone-based Firewall Policies, page 21-15</a> for more information about these policy maps.</p>                                                                                          |
| Protocol Info                   | <p>This option is available only when editing the Instant Messaging (AOL, ICQ, MSN Messenger, Windows Messenger, and Yahoo Messenger) and Stun-ice protocols.</p> <p>Enter or Select the name of the Protocol Info parameter map to be used with the selected protocol. These parameter maps define the DNS servers that interact with these applications, which helps the Instant Messaging (IM) application engine recognize the IM traffic and enforce the configured policy for that IM application.</p> <p>See <a href="#">Configuring Protocol Info Parameter Maps, page 21-32</a> for more information about these parameter maps.</p> |
| <b>Port Application Mapping</b> | These options let you customize the Port Application Mapping (PAM) parameters for the selected protocol.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Protocol                        | <p>Select the transport protocol(s) for this mapping:</p> <ul style="list-style-type: none"> <li>• TCP/UDP</li> <li>• TCP</li> <li>• UDP</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Ports                           | Enter any combination of a single port number, multiple port numbers, or a range of ports (for example, 60000-60005). Separate multiple entries with commas. Do not specify a range that overlaps already mapped ports.                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Table 21-26** *Configure Protocol Dialog Box (Continued)*

| <b>Element</b> | <b>Description</b>                                                                                                                                                                                                                                                         |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Networks       | If this protocol/port mapping is only for specific networks or hosts, enter the names or IP addresses of the networks or hosts, or the names of the network/host objects. You can click Select to open the Networks/Hosts Selector. Separate multiple entries with commas. |

## Managing Transparent Firewall Rules

---

Transparent firewall rules are access control rules for non-IP layer 2 traffic. You can use these rules to permit or drop traffic based on the Ethertype value in the layer-2 packet.

This chapter contains the following topics:

- [Configuring Transparent Firewall Rules, page 22-1](#)
- [Transparent Rules Page, page 22-3](#)

### Configuring Transparent Firewall Rules

Transparent firewall rules are access control rules for non-IP layer 2 traffic. You can use these rules to permit or drop traffic based on the Ethertype value in the layer-2 packet. These rules create Ethertype access control lists on the device. With transparent rules, you can control the flow of non-IP traffic across the device. (To control IP traffic, use access rules; see [Understanding Access Rules, page 16-1](#).)

Transparent firewalls are devices that you place within a single subnet to control traffic flow across a bridge. They allow you to insert a firewall on a subnet without renumbering your networks.

You can configure transparent rules only on the following types of interfaces:

- **IOS 12.3(7)T or higher devices**—On layer-3 interfaces that are part of a bridge group:
  - Configure the interfaces you want to bridge as layer 3 in the **Interfaces > Interfaces** policy.
  - Configure a bridge group with two or more layer 3 interfaces in the **Platform > Device Admin > Bridging** policy (see [Bridging on Cisco IOS Routers, page 60-18](#) and [Defining Bridge Groups, page 60-19](#)).
  - Create a bridge group virtual interface (BVI) using the same number as the bridge group (see [Bridge-Group Virtual Interfaces, page 60-18](#)). For example, if you create bridge group 12, create BVI12.
- **ASA, PIX 7.0+, FWSM devices**—On any interface when the device is running in transparent mode. If you are using multiple contexts, configure the rules on the individual security contexts.

There are several other bridging policies that you can configure in the **Platform > Bridging** policy group including: ARP table and ARP inspection, MAC table and the ability to disable MAC learning, and the ability to configure a management IP address so that you can remotely manage the device. For more detail about transparent firewalls, see [Chapter 46, “Configuring Bridging Policies on Firewall Devices”](#) and [Interfaces in Routed and Transparent Modes, page 45-4](#).

**Tip**

On ASA, PIX, and FWSM in transparent mode, you must configure access rules to allow any IP traffic to pass through the device. Transparent rules control layer 2 non-IP traffic only.

Also, see [NAT in Transparent Mode, page 23-15](#) for information about using network address translation on security devices.

You can also configure other types of firewall rules on these interfaces. The other types of rules apply to layer-3 and higher traffic.

**Tip**

If you configure any transparent rule, an implicit **deny all** rule is added at the end of the rule list for each interface. You must ensure that you permit all desired traffic. You might want to include a **permit any** (for ASA/PIX/FWSM devices) or **permit 0x0000 0xFFFF** (for IOS devices) rule as the final rule in the table if your desire is simply to deny specific types of traffic, rather than permitting only specific types of traffic.

**Related Topics**

- [Adding and Removing Rules, page 12-9](#)
- [Editing Rules, page 12-9](#)
- [Enabling and Disabling Rules, page 12-20](#)

**Step 1**

Do one of the following to open the [Transparent Rules Page, page 22-3](#):

- (Device view) Select **Firewall > Transparent Rules** from the Policy selector for a supported device type.
- (Policy view) Select **Firewall > Transparent Rules** from the Policy Type selector. Select an existing policy or create a new one.

**Step 2**

Select the row after which you want to create the rule and click the **Add Row** button or right-click and select **Add Row**. This opens the [Add and Edit Transparent Firewall Rule Dialog Boxes, page 22-5](#).

**Tip**

If you do not select a row, the new rule is added at the end of the local scope. You can also select an existing row and edit either the entire row or specific cells. For more information, see [Editing Rules, page 12-9](#).

**Step 3**

Configure the rule. Following are the highlights of what you typically need to decide. For specific information on configuring the fields, see [Add and Edit Transparent Firewall Rule Dialog Boxes, page 22-5](#).

- Permit or Deny—Whether you are allowing traffic that matches the rule or dropping it.
- Interfaces—The interface or interface role for which you are configuring the rule.
- The direction of traffic to which this rule should apply (in or out). The default is in.
- EtherType—The hexadecimal code or keyword (for ASA/PIX/FWSM only) that identifies the traffic. For a list of codes, see RFC 1700 at <http://www.ietf.org/rfc/rfc1700.txt> and search for “Ether Type.” For ASA/PIX/FWSM, you can select a keyword to identify some EtherTypes. For ASA/PIX/FWSM, the code must be 0x0600 at minimum.
- Mask—For rules applied to IOS devices, you must also specify a mask to apply to the EtherType. Use 0xFFFF to have the EtherType interpreted literally.

If you want to create a single rule to apply to a group of EtherTypes, convert the EtherTypes to binary and calculate an appropriate mask where 1 means to interpret the EtherType literally, and 0 means that any value should be allowed in the position. You must then convert your mask into hexadecimal.

Click **OK** when you are finished defining your rule.

- Step 4** If you did not select the right row before adding the rule, select the new rule and use the up and down arrow buttons to position the rule appropriately. For more information, see [Moving Rules and the Importance of Rule Order, page 12-19](#).
- Step 5** (IOS devices only) If you are configuring transparent rules on an IOS device, you can forward DHCP traffic across the bridge without inspection. To configure this, select the **Firewall > Settings > Inspection** policy and select the **Permit DHCP Passthrough (Transparent Firewall)** option. This setting is not supported on all IOS versions, so carefully inspect validation results to see if it will be configured on your device.

## Transparent Rules Page

Use the Transparent Rules page to control access for non-IP layer-2 traffic. (To control IP traffic access, use access rules; see [Understanding Access Rules, page 16-1](#).)

Transparent rules are limited to transparent firewalls, which are ASA, PIX 7.0+, and FWSM devices running in transparent mode, or layer-3 interfaces that are part of a bridge group on IOS 12.3(7)T+ devices. When deployed, transparent rules become Ethertype access control lists.

Configure the same rules on all bridged interfaces to allow traffic to pass both ways through the device.

For more detailed information about configuring transparent firewalls and the device requirements for deploying these rules, see [Configuring Transparent Firewall Rules, page 22-1](#).

### Tip

Disabled rules are shown with hash marks covering the table row. When you deploy the configuration, disabled rules are removed from the device. For more information, see [Enabling and Disabling Rules, page 12-20](#).

### Navigation Path

To access Transparent Rules, do one of the following:

- (Device view) Select **Firewall > Transparent Rules** from the Policy selector for a supported device type.
- (Policy view) Select **Firewall > Transparent Rules** from the Policy Type selector. Select an existing policy or create a new one.
- (Map view) Right-click a device and select **Edit Firewall Policies > Transparent Rules**.

|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.                                       | The ordered rule number.                                                                                                                                                                                                                                                                                                                                                                               |
| Permit                                    | Whether a rule permits or denies traffic based on the conditions set: <ul style="list-style-type: none"> <li>• Permit—Shown as a green check mark.</li> <li>• Deny—Shown as a red circle with slash.</li> </ul>                                                                                                                                                                                        |
| EtherType                                 | The Ethernet packet type, which is the EtherType value in the packet. This can be a hexadecimal code or a keyword.                                                                                                                                                                                                                                                                                     |
| Mask                                      | The 16-bit hexadecimal mask for the EtherType (for IOS devices only). A mask of 0xFFFF indicates the EtherType is literal. Any other mask indicates the corresponding bits in the EtherType to ignore. You must convert the hexadecimal number to binary to fully interpret the mask (binary 1 means interpret the corresponding EtherType value literally, 0 means allow any value at that position). |
| Interface                                 | The interfaces or interface roles to which the rule is assigned. Interface role objects are replaced with the actual interface names when the configuration is generated for each device. Multiple entries are displayed as separate subfields within the table cell. See <a href="#">Understanding Interface Role Objects, page 6-67</a> .                                                            |
| Dir.                                      | The direction of the traffic to which this rule applies: <ul style="list-style-type: none"> <li>• In—Packets entering the interface.</li> <li>• Out—Packets exiting the interface.</li> </ul>                                                                                                                                                                                                          |
| Category                                  | The category assigned to the rule. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-12</a> .                                                                                                                                                                                                                                                |
| Description                               | The description of the rule, if any.                                                                                                                                                                                                                                                                                                                                                                   |
| Last Ticket(s)                            | Shows the ticket(s) associated with last modification to the rule. You can click the ticket ID in the Last Ticket(s) column to view details of the ticket and to navigate to the ticket. If linkage to an external ticket management system has been configured, you can also navigate to that system from the ticket details (see <a href="#">Ticket Management Page, page 11-51</a> ).               |
| Up Row and Down Row buttons (arrow icons) | Click these buttons to move the selected rules up or down within a scope or section. For more information, see <a href="#">Moving Rules and the Importance of Rule Order, page 12-19</a> .                                                                                                                                                                                                             |
| Add Row button                            | Click this button to add a rule to the table after the selected row using the <a href="#">Add and Edit Transparent Firewall Rule Dialog Boxes, page 22-5</a> . If you do not select a row, the rule is added at the end of the local scope. For more information about adding rules, see <a href="#">Adding and Removing Rules, page 12-9</a> .                                                        |
| Edit Row button                           | Click this button to edit the selected rule. You can also edit individual cells. For more information, see <a href="#">Editing Rules, page 12-9</a> .                                                                                                                                                                                                                                                  |

**Table 22-1** *Transparent Rules Page (Continued)*

| Element           | Description                                    |
|-------------------|------------------------------------------------|
| Delete Row button | Click this button to delete the selected rule. |

## Add and Edit Transparent Firewall Rule Dialog Boxes

Use the Add and Edit Transparent Firewall Rule dialog boxes to add and edit transparent firewall rules, which are configured as EtherType access control lists on the device. Before you configure transparent rules, read [Configuring Transparent Firewall Rules, page 22-1](#).

### Navigation Path

From the [Transparent Rules Page, page 22-3](#), click the **Add Row** button or select a row and click the **Edit Row** button.

**Table 22-2** *Add and Edit Transparent Firewall Rule Dialog Boxes*

| Element     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Rule | Whether to enable the rule, which means the rule becomes active when you deploy the configuration to the device. Disabled rules are shown overlain with hash marks in the rule table. For more information, see <a href="#">Enabling and Disabling Rules, page 12-20</a> .                                                                                                                                                                                                                                                                                                                                                                                  |
| Action      | Whether the rule permits or denies traffic based on the conditions you define.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Interfaces  | The interfaces or interface roles to which the rule is assigned. You must select only bridged, transparent interfaces (for more specific information, see <a href="#">Configuring Transparent Firewall Rules, page 22-1</a> ).<br><br>Enter the name of the interface or the interface role, or click <b>Select</b> to select the interface or role from a list, or to create a new role. An interface must already be defined to appear on the list.<br><br>Interface role objects are replaced with the actual interface names when the configuration is generated for each device. See <a href="#">Understanding Interface Role Objects, page 6-67</a> . |

Table 22-2 Add and Edit Transparent Firewall Rule Dialog Boxes (Continued)

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Traffic Direction   | <p>The direction of the traffic to which this rule applies:</p> <ul style="list-style-type: none"> <li>In—Packets entering an interface.</li> <li>Out—Packets exiting an interface.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| EtherType           | <p>The hexadecimal code or keyword (for ASA/PIX/FWSM only) that identifies the traffic based on the EtherType value in the packet. Enter or select the following:</p> <ul style="list-style-type: none"> <li>The hexadecimal EtherType value. For a list of codes, see RFC 1700 at <a href="http://www.ietf.org/rfc/rfc1700.txt">http://www.ietf.org/rfc/rfc1700.txt</a> and search for “Ether Type.” <ul style="list-style-type: none"> <li>IOS devices—You can enter any value from 0x0000 to 0xFFFF.</li> <li>ASA/PIX/FWSM devices—The value must be 0x0600 or higher.</li> </ul> </li> <li>For ASA/PIX/FWSM devices, you can also select these keywords: <ul style="list-style-type: none"> <li>bpdu—Spanning Tree Bridge Protocol Data Units</li> <li>ipx—Internet Packet Exchange</li> <li>mpls-unicast—Multi-Protocol Label Switching, unicast.</li> <li>mpls-multicast—MPLS multicast.</li> <li>isis</li> <li>any—Any packet regardless of EtherType.</li> </ul> </li> </ul> <p><b>Tip</b> The keyword "isis" in the list above refers to IS-IS pass-through support, which is new in Security Manager 4.4. "IS-IS pass-through support" means that IS-IS traffic can flow through the ASA in transparent mode.</p> |
| Wildcard Mask (IOS) | <p>The mask is a 16-bit hexadecimal number that determines how the EtherType code is interpreted.</p> <p>A mask of 0xFFFF indicates the EtherType is literal. Any other mask indicates the corresponding bits in the EtherType to ignore. You must convert the hexadecimal number to binary to fully interpret the mask (binary 1 means interpret the corresponding EtherType value literally, 0 means allow any value at that position).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Category            | <p>The category assigned to the rule. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-12</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Description         | <p>An optional description of the rule (up to 1024 characters).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Edit Transparent EtherType Dialog Box

Use the Edit Transparent EtherType dialog box to edit the EtherType in a transparent firewall rule. Enter the hexadecimal code that identifies the traffic. For ASA/PIX/FWSM devices, you can also select the keyword for some types of traffic. For a list of codes, see RFC 1700 at <http://www.ietf.org/rfc/rfc1700.txt> and search for “Ether Type.” For a more detailed description of EtherType, see [Add and Edit Transparent Firewall Rule Dialog Boxes, page 22-5](#).

For more information, see [Configuring Transparent Firewall Rules, page 22-1](#).

### Navigation Path

Right-click the EtherType cell in a transparent rule (on the [Transparent Rules Page, page 22-3](#)) and select **Edit EtherType**. You can edit the EtherType for one row at a time.

## Edit Transparent Mask Dialog Box

Use the Edit Transparent Mask dialog box to edit the mask in a transparent firewall rule for an IOS device. The mask is a 16-bit hexadecimal number that determines how the EtherType code is interpreted.

A mask of 0xFFFF indicates the EtherType is literal. Any other mask indicates the corresponding bits in the EtherType to ignore. You must convert the hexadecimal number to binary to fully interpret the mask (binary 1 means interpret the corresponding EtherType value literally, 0 means allow any value at that position).

For more information, see [Configuring Transparent Firewall Rules, page 22-1](#).

### Navigation Path

Right-click the Mask cell in a transparent rule (on the [Transparent Rules Page, page 22-3](#)) and select **Edit Mask**. You can edit the mask for one row at a time.

## CHAPTER 23

# Configuring Network Address Translation

---

These topics provide conceptual information about network address translation (NAT) in general, and about translation types and various implementations:

# Understanding Network Address Translation

Address translation substitutes the real address in a packet with a mapped address that is routable on the destination network. As part of the process, the device also records the substitution in a translation database; these records are known as “xlate” entries. The appropriate xlate entry must exist to allow address translation on return packets—the substitution of the original real address for the mapped address; this procedure is sometimes referred to as “untranslation.” Thus, network address translation (NAT) actually consists of two steps: the translation of a real address into a mapped address, and the reverse translation for returning traffic.

One of the main functions of NAT is to enable private IP networks to connect to the Internet. Network address translation replaces a private IP address with a public IP address, translating the private addresses in the internal network into legal, routable addresses that can be used on the public Internet. In this way, NAT conserves public addresses; for example, NAT rules can be configured to utilize only one public address for the entire network in communications with the outside world.

Other functions of NAT include:

- Security – Keeping internal IP addresses hidden discourages direct attacks.
- IP routing solutions – Overlapping IP addresses are not a problem.
- Flexibility – You can change internal IP addressing schemes without affecting the public addresses available externally. For example, for a server accessible to the Internet, you can maintain a fixed IP address for Internet use, but internally, you can change the server address.

Cisco devices support both NAT, which provides a globally unique address for each outbound host session, and Port Address Translation (PAT), which provides the same single address combined with a unique port number, for up to 64,000 simultaneous outbound or inbound host sessions. The global addresses used for NAT come from a pool of addresses specifically designated for address translation. The unique global address that is used for PAT can be either one global address, or the IP address of a given interface.

The device translates an address when an existing NAT rule matches the specific traffic. If no NAT rule matches, processing for the packet continues. The exception is when you enable NAT control. NAT control requires that packets traversing from a higher security interface (inside) to a lower security interface (outside) match a NAT rule, or processing for the packet stops.

Cisco devices can perform NAT or PAT on both inbound and outbound connections. This ability to translate inbound addresses is called “Outside NAT” because addresses on the outside, or less secure, interface are translated to a usable inside IP address. Just as when you translate outbound traffic, you may choose dynamic NAT, static NAT, dynamic PAT, or static PAT. If necessary, you can use outside NAT together with inside NAT to translate the both source and destination IP addresses of a packet.

**Note**

In this document, all types of translation are generally referred to as NAT; see [Types of Address Translation, page 23-3](#) for descriptions of the various types. When describing NAT, the terms inside and outside represent the security relationship between any two interfaces. The higher security level is inside and the lower security level is outside.

The release of ASA version 8.3 provides a simplified, interface-independent approach to configuring network address translation, as compared to earlier ASA versions and other devices. See [About “Simplified” NAT on ASA 8.3+ Devices, page 23-3](#) for more information.

## Types of Address Translation

The following table briefly describes the various types of address translation.

**Table 23-1** *Types of Address Translation*

|                    |                                                                                                                                                                                                                                                                                                            |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Static NAT         | Fixed translation of real source addresses to specific mapped addresses—each source address is always translated to the same mapped address, regardless of IP protocol and port number.                                                                                                                    |
| Static PAT         | Fixed translation of real source addresses with specific TCP or UDP port numbers, to specific mapped addresses and ports. That is, each source address/port is always translated to the same mapped address/port.                                                                                          |
| Policy Static NAT  | Fixed translation of real source addresses to specific mapped addresses. Destination networks/hosts are also specified, and the service is always IP.                                                                                                                                                      |
| Policy Static PAT  | Fixed translation of real source addresses with specific TCP or UDP port numbers, to specific mapped addresses and ports. Destination networks/hosts and services are also specified.                                                                                                                      |
| Dynamic NAT        | Dynamic translation of real source addresses to mapped addresses obtained from a pool of shared addresses. Each source address can be mapped to any available address in the pool.                                                                                                                         |
| Dynamic PAT        | Translation of real source addresses to a single mapped address; singularity is provided by dynamic translation of related port numbers. That is, each real address/port combination is translated to the same mapped address, but assigned a unique port. This is sometimes referred to as “overloading.” |
| Policy Dynamic NAT | Dynamic translation of specific source-address/destination-address/service combinations on a given interface, using a pool of shared addresses. Translation direction—outbound or inbound—is also specified.                                                                                               |
| Identity NAT       | The specified address is translated to itself—that is, it is effectively not translated; applies to outbound connections only. Identity NAT is a particular type of Static NAT.                                                                                                                            |
| NAT Exempt         | Translation is bypassed for specified source/destination address combinations; connections can be initiated in both the outbound and inbound directions.                                                                                                                                                   |

### Note

While certain of these types do not apply to ASA 8.3 and later devices, the ASA 8.3+ devices do provide a Dynamic NAT and PAT option, which is Dynamic NAT with a Dynamic PAT back-up feature.

## About “Simplified” NAT on ASA 8.3+ Devices

The release of ASA version 8.3 provides a simplified approach to configuring network address translation (NAT), as compared to earlier ASA versions and other devices. Configuration of NAT was simplified by replacing the earlier flow-based scheme with an “original packet” to “translated packet” approach.

All NAT rules on the device—static NAT, dynamic PAT, and dynamic NAT—are presented in a single table, and essentially the same dialog box is used to configure all NAT rules. The NAT rules are interface independent (that is, interfaces are optional), meaning the rules are independent of security levels also.

NAT rules are no longer dependent on security levels. A global address space consisting of all interfaces is available, and is specified using the keyword “any.” All Interface fields default to **any**, so unless a specific interface is provided, the rule is applicable to all interfaces.

### Network Object NAT

You also can define NAT properties on Host, Address Range, and Network objects, such that corresponding NAT rules are applied automatically to the designated security device. Using these objects means you need enter the necessary IP addresses, services, ports, and optional interfaces only once. These automatically generated, object-based rules are referred to as “Network Object NAT” rules. Note that these rules cannot be created or deleted from the rules table; you must edit the appropriate objects in the Policy Object Manager. You can, however, edit these rules from the rules table after they have been defined for the network object. For more information, see [Add or Edit Network/Host Dialog Box: NAT Tab, page 23-41](#).

#### Note

---

Network Object NAT rules are not displayed in the Translation Rules table in Policy View because these rules are device-specific.

---

### The NAT Table

As mentioned, all NAT rules on a device are presented in a single table, which is divided into three sections: a “manual” section, the Network Object NAT rules section, and another manual-rules section. You can add, edit and order rules in both manual sections; the Network Object NAT rules are added and ordered automatically, and as mentioned, to edit these rules you must edit the related objects.

The NAT rules in the table are applied on a top-down, first-match basis. That is, a packet is translated only when it matches a NAT rule, and as soon as a match is made, regardless of its location or section, NAT rule processing stops.

You can use this table to organize and manage the manual rules—you can insert rules in any order, and you can re-order them. The two sections of manual rules are provided to let you order manual rules both before and after the automatic object rules.

Network Object NAT rules are automatically ordered such that static rules appear before dynamic rules. These two types are each further ordered as follows:

- Fewest number of IP addresses – Rules for objects with one IP address are listed before those for objects with two addresses, which are before those with three addresses, and so on.
- IP address numbers – For objects having the same number of IP addresses, the rules are arranged such that the IP addresses themselves are in numerical order, from lower to higher. For example, 10.1.1.1 rules are listed before 11.1.1.1 rules.
- Object names – If the IP address is the same, the rules are ordered by alphabetizing the object names.

And remember, translation is based on the first matching rule.

### Destination Translation

With manual static rules, in addition to source address translation, you also can configure destination address translation. Source and destination translation are defined at the same time, in the same dialog box. Again, while source translation can be static or dynamic, destination translation is always static, and is only available with manual rules.

### Bi-directional or Twice NAT

When creating a manual static rule, you can select the “Bi-directional” option, which will produce an entry in the rules table that actually represents two static NAT rules, encompassing both translation directions. That is, a static rule is created for the specified source/translated address pairing, along with a mirror rule for the translated address/source pairing.

For example, if Bi-directional is chosen when you create a static rule with Host1 in the Source field and Host2 in the Translated field, two lines are added to the rules table: one with Host1 being translated to Host2, and one with Host2 being translated to Host1.

This is sometimes referred to as “Twice NAT” because only one look-up is required to fetch and process what is in effect two rules.

### Many-to-one Addressing

Generally, static NAT rules are configured with one-to-one address mapping. However, you can now define static NAT rules in which many IP addresses map to a few or one IP address. Functionally, many-to-few is the same as many-to-one, but because the configuration is more complicated, we recommend creating a many-to-one rule for each address as needed.

Many-to-one addressing might be useful, for example, in a situation where a range of public IP addresses is used to reach a load balancer which redirects requests to an internal network.

## NAT Policies on Cisco IOS Routers

You can configure NAT policies on a Cisco IOS router from the following tabs on the NAT policy page:

- [NAT Page: Interface Specification, page 23-6](#)
- [NAT Page: Static Rules, page 23-6](#)
- [NAT Page: Dynamic Rules, page 23-10](#)
- [NAT Page: Timeouts, page 23-13](#)

Network Address Translation (NAT) converts private, internal LAN addresses into globally routable IP addresses. NAT enables a small number of public IP addresses to provide global connectivity for a large number of hosts.

For more information, see [Understanding Network Address Translation, page 23-2](#).

### Navigation Path

- (Device view) Select **NAT** from the Policy selector.
- (Policy view) Select **NAT (Router)** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## NAT Page: Interface Specification

Before creating NAT rules, you must define the “direction” of the traffic to be translated by specifying the Inside and Outside interfaces. Inside interfaces typically connect to a LAN that the router serves. Outside interfaces typically connect to your organization’s WAN or to the Internet. You must designate at least one Inside interface and one Outside interface to enable the router to perform network address translation.

The Inside and Outside designations are used when interpreting translation rules: addresses connected to the Inside interface are translated to addresses on the Outside interface. After these interfaces are defined, they are used in all static and dynamic NAT translation rules.

Use the Interface Specification tab of the NAT policy page to specify the Inside and Outside interfaces.

### Navigation Path

- (Device view) Select **NAT** from the Policy selector, then click the **Interface Specification** tab.
- (Policy view) Select **NAT (Router) > Translation Rules** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Interface Specification** tab.

### Defining the Inside and Outside Interfaces

In the NAT **Inside Interfaces** and **NAT Outside Interfaces** fields, enter or Select the names of the interfaces or interface roles for the Inside and Outside interfaces, respectively. Separate multiple names or roles with commas (for example, Ethernet1/1, Ethernet1/2). Note that you cannot enter the same name in both fields.

## NAT Page: Static Rules

You define a static NAT rule by specifying a local address that must be translated, as well as the global address to which it is translated. This is a static or fixed mapping—the local address is always translated to the same global address.

You can define static NAT rules that translate the addresses of single hosts, as well as static rules that translate multiple addresses in a subnet. When multiple local addresses must use the same global address, you must define the necessary port redirection information, which defines a different port for each local address using the global address.

### Note

We strongly recommend that you do not perform NAT on traffic that will be transmitted over a VPN. Translating addresses on this traffic causes it to be sent out unencrypted instead of encrypted over the VPN.

The procedure for creating a static rule depends on whether the address being translated represents a port, a single host, or an entire subnet:

- You define a **static NAT rule for a single host** by entering the original address to translate and the global address to which it is translated. The global address may be taken from an interface on the device.
- You define a **static NAT rule for a subnet** by entering one of the addresses in the subnet (including the subnet mask) as the original address, and one of the global addresses that you want to use as the translated address. The router configures the remaining addresses based on the subnet mask you provide.
- You define a **static NAT rule for a port** by entering the original IP address and the global address to which it should be translated. The global address may be taken from an interface on the device. In addition, you must select the protocol used by the port, as well as the local and global port numbers.

The Add Static NAT Rule and Edit Static NAT Rule dialog boxes are used to add and edit these rules. Refer to [NAT Static Rule Dialog Boxes, page 23-7](#) for descriptions of the fields displayed in the table on this page.

#### Before You Begin

- Define the inside and outside interfaces used for NAT. See [NAT Page: Interface Specification, page 23-6](#).

#### Navigation Path

- (Device view) Select **NAT** from the Policy selector, then click the **Static Rules** tab.
- (Policy view) Select **NAT (Router) > Translation Rules** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Static Rules** tab.

| Static Rule Type   | <p>The type of local address to be translated by this static rule:</p> <ul style="list-style-type: none"> <li>• <b>Static Host</b> – A single host requiring static address translation.</li> <li>• <b>Static Network</b> – A subnet requiring static address translation.</li> <li>• <b>Static Port</b> – A single port requiring static address translation. If you select this option, you must define the Port Redirection parameters.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Original Address   | <p>An IP address, or the name of a network/host object representing the address(es) to be translated. You can enter or Select the object name.</p> <p>Network/host objects are logical collections of IP addresses that represent networks, hosts, or both. See <a href="#">Understanding Networks/Hosts Objects, page 6-74</a> for more information.</p> <p><b>Note</b> Do not enter a local address belonging to this router, as it could cause Security Manager management traffic to be translated. Translating this traffic will cause a loss of communication between the router and Security Manager.</p>                                                                                                                                                                                                                                                                                                                                 |
| Translated Address | <p>Use the options in this section of the dialog box to specify the address(es) to which the Original Address(es) are translated:</p> <ul style="list-style-type: none"> <li>• <b>Specify IP</b> – Select this option to specify an IP address, or the name of a network/host object that provides the translated address(es). Add an IP address, or the name of a network/host object, in the <b>Translated IP/Network</b> field. You can enter or Select the object name.</li> <li>• <b>Use Interface IP</b> – Select this option to specify that the IP address assigned to a particular interface be used as the translated address. Enter or Select the name of the desired <b>Interface</b>. (This is typically the interface from which translated packets leave the router.)</li> </ul> <p><b>Note</b> This option is not available when Static Network is the chosen rule type. Only one static rule may be defined per interface.</p>  |
| Port Redirection   | <p>These parameters specify port information for the address translations. Port address translation lets you to use the same public IP address for multiple devices as long as the port specified for each device is different.</p> <p><b>Note</b> These parameters are available only when Static Port is the chosen rule type.</p> <p><b>Redirect Port</b> – When Static Port is chosen as the rule type, this box is automatically checked; it cannot be changed. Enter the appropriate information in the following fields:</p> <ul style="list-style-type: none"> <li>• <b>Protocol</b> – The communications protocol used for these ports: TCP or UDP.</li> <li>• <b>Local Port</b> – The port number on the source network. Valid values range from 1 to 65535.</li> <li>• <b>Global Port</b> – The port number on the destination network that the router is to use for this translation. Valid values range from 1 to 65535.</li> </ul> |

**Table 23-2 Add/Edit NAT Static Rule Dialog Boxes (Continued)**

| Element  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Advanced | <p>This section contains optional, advanced translation options.</p> <p><b>Note</b> The Advanced options are available only when the Specify IP option is the selected method for defining the translated address(es).</p> <ul style="list-style-type: none"> <li>• <b>No Alias</b> – When selected, disables automatic aliasing for the global IP address translation.</li> </ul> <p>If the NAT pool used as an inside global pool consists of addresses on an attached subnet, an alias is generated for that address so that the router can answer Address Resolution Protocol (ARP) requests for those addresses.</p> <p>When deselected, global address aliases are permitted.</p> <ul style="list-style-type: none"> <li>• <b>No Payload</b> – When selected, prohibits an embedded address or port in the payload from being translated.</li> </ul> <p>The payload option performs NAT between devices on overlapping networks that share the same IP address. When an outside device sends a DNS query to reach an inside device, the local address inside the payload of the DNS reply is translated to a global address according to the relevant NAT rule.</p> <p>You can disable this feature by selecting the No Payload option. Otherwise, embedded addresses and ports in the payload may be translated. See <a href="#">Disabling the Payload Option for Overlapping Networks, page 23-9</a> for more information.</p> <ul style="list-style-type: none"> <li>• <b>Create Extended Translation Entry</b> – When checked, extended translation entries (addresses and ports) are created in the translation table. This lets you associate multiple global addresses with a single local address. This is the default.</li> </ul> <p>When this option is deselected, simple translation entries are created, allowing association of a single global address with the local address.</p> <p><b>Note</b> This option is not available when Static Port is the chosen rule type.</p> |

### Disabling the Payload Option for Overlapping Networks

Overlapping networks result when you assign an IP address to a device on your network that is already legally owned and assigned to a different device on the Internet or outside network. Overlapping networks can also result after the merger of two companies using RFC 1918 IP addresses in their networks. These two networks need to communicate, preferably without your having to re-address all their devices.

This communication is achieved as follows. The outside device cannot use the IP address of the inside device because it is the same as the address assigned to itself (the outside device). Instead, the outside device sends a Domain Name System (DNS) query for the inside device's domain name. The source of this query is the IP address of the outside device, which is translated to an address from a designated address pool. The DNS server located on the inside network replies with the IP address associated with the inside device's domain name in the data portion of the packet. The destination address of the reply packet is translated back to the outside device's address, and the address in the data portion of the reply packet is translated to an address from a different address pool. In this way, the outside device learns that

the IP address for the inside device is one of the addresses from that second address pool, and it uses this address when it communicates with the inside device. The router running NAT takes care of the translations at this point.

To disable the translation of the address inside the payload, check the **No Payload** option when you create a static NAT rule based on a global IP translation.

## NAT Page: Dynamic Rules

Use the NAT Dynamic Rules tab of the router's NAT page to manage dynamic address translation rules. A dynamic address translation rule dynamically maps hosts to addresses, using either the IP address of a specific interface (with dynamic port translation), or the addresses included in an address pool that are globally unique in the destination network.

### Defining Dynamic NAT Rules

You define a dynamic NAT rule by first selecting an access control list (ACL) whose rules specify the traffic requiring translation.

Then, you must either select an interface with an IP address to which the addresses should be translated, or define a pool of addresses to be used. You define the pool by specifying a range of addresses and giving the range a unique name; you can specify multiple ranges. The router uses the available addresses in the pool (those not used for static translations, or for its own WAN IP address) for connections to the Internet or another outside network. When an address is no longer in use, it is returned to the address pool to be dynamically assigned later to another device.

If the addressing requirements of your network exceed the available addresses in your dynamic NAT pool, you can use the Port Address Translation (PAT) feature (also called Overloading) to associate many private addresses with one or a small group of public IP address, using port addressing to make each translation unique. With PAT enabled, the router chooses a unique port number for the IP address of each outbound translation slot. This feature is useful if you cannot allocate enough unique IP addresses for your outbound connections. Note that Port Address Translation does not occur until the address pool is depleted.

#### Note

By default, Security Manager does not perform NAT on traffic that is meant to be transmitted over a VPN. Otherwise, any traffic appearing in both the NAT ACL and the crypto ACL defined on an interface would be sent out unencrypted because NAT is always performed before encryption. However, you can change this default setting.

#### Tip

You can perform PAT on split-tunneled traffic on the spokes of your VPN topology directly from the Global VPN Settings page. There is no need to create a dynamic NAT rule for each spoke. Any NAT rules that you define on an individual device override the VPN setting. For more information, see [Configuring VPN Global NAT Settings, page 25-38](#).

The Add Dynamic NAT Rule and Edit Static NAT Rule dialog boxes are used to add and edit these rules. Refer to [NAT Dynamic Rule Dialog Box, page 23-11](#) for descriptions of the fields displayed in the table on this page.

### Before You Begin

- Define the inside and outside interfaces used for NAT. See [NAT Page: Interface Specification, page 23-6](#).

**Navigation Path**

- (Device view) Select **NAT** from the Policy selector, then click the **Dynamic Rules** tab.
- (Policy view) Select **NAT (Router) > Translation Rules** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Dynamic Rules** tab.

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Translated Address | <p>Use the options in this section of the dialog box to specify the method and address(es) used for dynamic translation:</p> <ul style="list-style-type: none"> <li> <b>Use Interface IP</b> – Select this option to specify that the globally registered IP address assigned to a particular interface be used as the translated address; port addressing ensures each translation is unique. (The Enable Port Translation (Overload) option is checked automatically when you select Use Interface IP.) </li> </ul> <p>Enter or Select the name of the desired <b>Interface</b>. This is typically the interface from which translated packets leave the router, meaning the interface or interface role must represent an outside interface on the router (see <a href="#">NAT Page: Interface Specification, page 23-6</a>).</p> <ul style="list-style-type: none"> <li> <b>Address Pool</b> – Select this option to base address translation on the addresses you specify in the <b>Network Ranges</b> pool. </li> </ul> <p>Enter one or more address ranges, including the prefix, using the format <code>min1-max1/prefix</code> (in CIDR notation), where “prefix” represents a valid netmask. For example, <code>172.16.0.0-172.31.0.223/12</code>.</p> <p>You can add as many address ranges to the address pool as required, but all ranges must share the same prefix. Separate multiple entries with commas.</p>                                                                                                                                                                                                                                                   |
| Settings           | <p>This section contains two options</p> <ul style="list-style-type: none"> <li> <b>Enable Port Translation (Overload)</b> – When selected, the router uses port addressing (PAT) if supply of global addresses in the address pool is depleted; when deselected, PAT is not used. </li> </ul> <p><b>Note</b> When you use select Use Interface IP in the Translated Address section, this box is checked automatically; it cannot be changed.</p> <ul style="list-style-type: none"> <li> <b>Do Not Translate VPN Traffic (Site-to-Site VPN only)</b> – Deselect this option to allow address translation on traffic intended for a site-to-site VPN. </li> </ul> <p>When selected, address translation is not performed on VPN traffic. When deselected, the router performs address translation on VPN traffic in cases of overlapping addresses between the NAT ACL and the crypto ACL.</p> <p><b>Note</b> We strongly recommend that you not deselect this option, or any traffic defined in both the NAT ACL and the crypto ACL will be sent unencrypted. When you perform NAT into IPsec, we also recommend that you leave this option selected; it does not interfere with the translation of addresses arriving from overlapping networks.</p> <p>This setting applies only in situations where the NAT ACL overlaps the crypto ACL used by the site-to-site VPN. Because the interface performs NAT first, any traffic arriving from an address within this overlap would get translated, causing the traffic to be sent unencrypted. Leaving this box checked prevents that from happening.</p> <p><b>Note</b> This option does not apply to remote access VPNs.</p> |

## NAT Page: Timeouts

Use the NAT Timeouts tab of the router's NAT page to manage the timeout values for port address (overload) translations. These timeouts cause a dynamic translation to expire after a specified period of inactivity. In addition, you can use options on this page to place a limit on the number of entries allowed in the dynamic NAT table, and to modify the default timeout on all dynamic translations that do not include PAT processing.

### About Dynamic NAT Timeouts

Dynamic NAT translations have a timeout period for non-use, after which they expire and are purged from the translation table. If you enable the Overload feature for performing PAT, you can specify a variety of values that provide finer control over these timeouts, because each translation entry contains additional contextual information about the traffic using it.

For example, non-DNS translations time out by default after five minutes, but DNS translations time out after 1 minute. Further, TCP translations time out after 24 hours, unless an RST or FIN is seen on the stream, in which case they time out after one minute. You can change any of these timeout values.

#### Note

If you disable the Port Translation (Overload) feature for all dynamic rules, you need not enter any PAT-related timeout values. However, you can still modify the default timeout value for non-PAT dynamic translations. (By default, all dynamic translations expire after 24 hours.) For more information about the Overload feature, see [NAT Dynamic Rule Dialog Box, page 23-11](#).

### Navigation Path

- (Device view) Select **NAT** from the Policy selector, then click the **Timeouts** tab.
- (Policy view) Select **NAT (Router) > Translation Rules** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Timeouts** tab.

### Field Reference

**Table 23-4 NAT Timeouts Tab**

| Element        | Description                                                                                                                                                                                                                       |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Max Entries    | The maximum number of entries allowed in the dynamic NAT table. You can enter a value between 1 and 2147483647, or you can leave the field blank (the default), which means that the number of entries in the table is unlimited. |
| Timeout (sec.) | The number of seconds after which dynamic translations expire; this does not apply to PAT (overload) translations. The default is 86400 seconds (24 hours).                                                                       |

Table 23-4 NAT Timeouts Tab (Continued)

| Element               | Description                                                                                                                                                                                                                                                                                                                                                |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UDP Timeout (sec.)    | <p>The timeout value applied to User Datagram Protocol (UDP) ports. The default is 300 seconds (5 minutes).</p> <p><b>Note</b> This value applies only when Port Translation (Overload) is enabled for a dynamic NAT rule; see <a href="#">NAT Dynamic Rule Dialog Box, page 23-11</a>.</p>                                                                |
| DNS Timeout (sec.)    | <p>The timeout value applied to Domain Naming System (DNS) server connections. The default is 60 seconds.</p> <p><b>Note</b> This value applies only when Port Translation (Overload) is enabled for a dynamic NAT rule; see <a href="#">NAT Dynamic Rule Dialog Box, page 23-11</a>.</p>                                                                  |
| TCP Timeout (sec.)    | <p>The timeout value applied to Transmission Control Protocol (TCP) ports. The default is 86400 seconds (24 hours).</p> <p><b>Note</b> This value applies only when Port Translation (Overload) is enabled for a dynamic NAT rule; see <a href="#">NAT Dynamic Rule Dialog Box, page 23-11</a>.</p>                                                        |
| FINRST Timeout (sec.) | <p>The timeout value applied when a Finish (FIN) packet or Reset (RST) packet (both of which terminate connections) is found in the TCP stream. The default is 60 seconds.</p> <p><b>Note</b> This value applies only when Port Translation (Overload) is enabled for a dynamic NAT rule; see <a href="#">NAT Dynamic Rule Dialog Box, page 23-11</a>.</p> |
| ICMP Timeout (sec.)   | <p>The timeout value applied to Internet Control Message Protocol (ICMP) flows. The default is 60 seconds.</p> <p><b>Note</b> This value applies only when Port Translation (Overload) is enabled for a dynamic NAT rule; see <a href="#">NAT Dynamic Rule Dialog Box, page 23-11</a>.</p>                                                                 |
| PPTP Timeout (sec.)   | <p>The timeout value applied to NAT Point-to-Point Tunneling Protocol (PPTP) flows. The default is 86400 seconds (24 hours).</p> <p><b>Note</b> This value applies only when Port Translation (Overload) is enabled for a dynamic NAT rule; see <a href="#">NAT Dynamic Rule Dialog Box, page 23-11</a>.</p>                                               |
| SYN Timeout (sec.)    | <p>The timeout value applied to TCP flows after a synchronous transmission (SYN) message (used for precise clocking) is encountered. The default is 60 seconds.</p> <p><b>Note</b> This value applies only when Port Translation (Overload) is enabled for a dynamic NAT rule; see <a href="#">NAT Dynamic Rule Dialog Box, page 23-11</a>.</p>            |

# NAT Policies on Security Devices

The following topics describe configuring network address translation (NAT) options on managed security appliances: PIX firewalls, Firewall Service Modules (FWSMs) on Catalyst switches, pre-version-8.3 Adaptive Security Appliances (ASAs), and ASA 8.3+ devices. The topics are arranged as follows:

- [NAT in Transparent Mode, page 23-15](#)
- [Translation Options Page, page 23-15](#)
- **PIX, FWSM, and pre-8.3 ASA**
  - [Configuring NAT on PIX, FWSM, and pre-8.3 ASA Devices, page 23-17](#)
  - [Address Pools, page 23-17](#)
  - [Translation Rules: PIX, FWSM, and pre-8.3 ASA, page 23-18](#)
- **ASA 8.3+**
  - [Configuring NAT on ASA 8.3+ Devices, page 23-32](#)
  - [Translation Rules: ASA 8.3+, page 23-32](#)

## NAT in Transparent Mode

Using NAT on a security appliance operating in transparent mode eliminates the need for upstream or downstream routers to perform NAT for their networks. NAT in transparent mode has the following requirements and limitations:

- When the mapped addresses are not on the same network as the transparent firewall, you need to add a static route for the mapped addresses on the upstream router that points to the downstream router (through the security appliance).
- If the real destination address is not directly connected to the security appliance, you also need to add a static route on the security appliance for the real destination address that points to the downstream router. Without NAT, traffic from the upstream router to the downstream router does not need any routes on the security appliance because it uses the MAC address table. Using NAT, however, causes the security appliance to use a route look-up instead of a MAC address look-up, so it needs a static route to the downstream router.
- Because the transparent firewall does not have any interface IP addresses, you cannot use interface PAT.
- ARP inspection is not supported. Moreover, if for some reason a host on one side of the security appliance sends an ARP request to a host on the other side of the security appliance, and the initiating host real address is mapped to a different address on the same subnet, then the real address remains visible in the ARP request.

## Translation Options Page

Use the Translation Options page to set options that affect network address translation for the selected security appliance. These settings apply to all interfaces on the device.

### Navigation Path

- (Device view) Select **NAT > Translation Options** from the Device Policy selector.

- (Policy view) Select **NAT (PIX/ASA/FWSM) > Translation Options** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or right-click **Translation Options** to create a new policy.

**Table 23-5 Translation Options Page**

| Element                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable traffic through the firewall without address translation | <p>When selected, lets traffic pass through the security appliance without address translation. If this option is not selected, any traffic that does not match a translation rule will be dropped.</p> <p><b>Note</b> This option is available only on PIX 7.x, FWSM 3.x, and ASA devices.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Enable xlate bypass                                             | <p>When selected, establishment of NAT sessions for untranslated traffic is disabled (this feature is called “xlate bypass”).</p> <p><b>Note</b> This option is available only on FWSM 3.2 and higher.</p> <p>By default, the FWSM creates NAT sessions for all connections even if NAT is not used. For example, a session is created for each untranslated connection even if NAT control is not enabled, if NAT exemption or identity NAT is used, or if you use same-security interfaces and do not configure NAT. Because there is a maximum number of NAT sessions (266,144 concurrent), these kinds of NAT sessions might cause you to run into the limit. To avoid reaching the limit, enable xlate bypass.</p> <p>If you disable NAT control and have untranslated traffic or use NAT exemption, or if you enable NAT control and use NAT exemption, then with xlate bypass, the FWSM does not create a session for those types of untranslated traffic. However, NAT sessions are still created in the following instances:</p> <ul style="list-style-type: none"> <li>• You configure identity NAT (with or without NAT control)—identity NAT is considered to be a translation.</li> <li>• You use same-security interfaces with NAT control. Traffic between same-security interfaces create NAT sessions even when you do not configure NAT for the traffic. To avoid NAT sessions in this case, disable NAT control, or use NAT exemption as well as xlate bypass.</li> </ul> |
| Do not translate VPN traffic                                    | <p>When selected, VPN traffic passes through the security appliance without address translation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Clear translates for existing connections                       | <p>When selected, the translation slots assigned to dynamic translations and any associated connections are cleared following each session.</p> <p>Each session connecting through the security appliance, and undergoing some form of NAT or PAT, is assigned a translation slot known as an “xlate.” These translation slots can persist after the session is complete, which can lead to a depletion of translation slots, unexpected traffic behavior, or both.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Configuring NAT on PIX, FWSM, and pre-8.3 ASA Devices

The following sections describe configuring network address translation on PIX and FWSM devices, and on pre-8.3-version ASAs. (See [Configuring NAT on ASA 8.3+ Devices, page 23-32](#) for information about configuring NAT on ASA 8.3+ devices.)

- [Address Pools, page 23-17](#)
- [Translation Rules: PIX, FWSM, and pre-8.3 ASA, page 23-18](#)
  - [Translation Exemptions \(NAT 0 ACL\), page 23-19](#)
  - [Dynamic Rules Tab, page 23-21](#)
  - [Policy Dynamic Rules Tab, page 23-23](#)
  - [Static Rules Tab, page 23-25](#)
  - [General Tab, page 23-30](#)

### Address Pools

Use the Address Pools page to view and manage the global address pools used in dynamic NAT rules. The Address Pool dialog box is used to add and edit these address pools. Refer to [Address Pool Dialog Box, page 23-17](#) for descriptions of the fields displayed in the Global Address Pools table on this page.

#### Navigation Path

- (Device view) Select **NAT > Address Pools** from the Device Policy selector.
- (Policy view) Select **NAT (PIX/ASA/FWSM) > Address Pools** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or right-click **Address Pools** to create a new policy.

- [Configuring NAT on PIX, FWSM, and pre-8.3 ASA Devices, page 23-17](#)

### Address Pool Dialog Box

Use the Address Pool dialog box to add or edit a global address pool for use in dynamic NAT rules.

#### Navigation Path

You open the Address Pool dialog box by clicking the Add Row or Edit Row buttons on the [Address Pools, page 23-17](#).

#### Related Topics

- [Configuring NAT on PIX, FWSM, and pre-8.3 ASA Devices, page 23-17](#)

|----------------|-------------------------------------------------------------------------------------------------|
| Interface Name | Enter or Select the name of the device interface on which the mapped IP addresses will be used. |

Table 23-6 Address Pools Dialog Box (Continued)

| Element              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Pool ID              | Enter a unique identification number for this address pool, an integer between 1 and 2147483647. When configuring a dynamic NAT rule, you select a Pool ID to specify the pool of addresses to be used for translation.                                                                                                                                                                                                                                                                                                                                                                                        |
| IP address ranges    | Enter or Select the addresses to be assigned to this address pool. You can specify these addresses as follows: <ul style="list-style-type: none"> <li>Address range for dynamic NAT (e.g., 192.168.1.1-192.168.1.15)</li> <li>Subnetwork (e.g., 192.168.1.0/24)</li> <li>List of addresses separated by commas (e.g., 192.168.1.1, 192.168.1.2, 192.168.1.3)</li> <li>Single address to use for PAT (e.g., 192.168.1.1)</li> <li>Combinations of the above (e.g., 192.168.1.1-192.168.1.15, 192.168.1.25)</li> <li>Names of hosts on the connected network; these will be resolved to IP addresses.</li> </ul> |
| Description          | Enter a description for the address pool.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Enable Interface PAT | When checked, port address translation is enabled on the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Translation Rules: PIX, FWSM, and pre-8.3 ASA

Use the Translation Rules page to define network address translation (NAT) rules on the selected device. The Translation Rules page consists of the following tabs:

- [Translation Exemptions \(NAT 0 ACL\), page 23-19](#) – Use this tab to configure rules specifying traffic that is exempt from address translation.

**Note** Translation exemptions are only supported by PIX, ASA and FWSM devices in router mode, and FWSM 3.2 devices in transparent mode. Other devices in transparent mode support only static translation rules.

- [Dynamic Rules Tab, page 23-21](#) – Use this tab to configure dynamic NAT and PAT rules.

**Note** Dynamic translation rules are only supported by PIX, ASA and FWSM devices in router mode, and FWSM 3.2 devices in transparent mode. Other devices in transparent mode support only static translation rules.

- [Policy Dynamic Rules Tab, page 23-23](#) – Use this tab to configure dynamic translation rules based on source and destination addresses and services.

**Note** Policy dynamic rules are only supported by PIX, ASA and FWSM devices in router mode, and FWSM 3.2 devices in transparent mode. Other devices in transparent mode support only static translation rules.

- [Static Rules Tab, page 23-25](#) – Use this tab to configure static translation rules for a security appliance or shared policy.
- [General Tab, page 23-30](#) – Use this tab to view all current translation rules, listed in the order that they will be evaluated on the device.

**Note** The General tab is visible only for PIX, ASA and FWSM devices in router mode, and FWSM 3.2 devices in transparent mode. Other devices in transparent mode support only static translation rules and do not need to display summary information.

#### Navigation Path

To access the Translation Rules page, do one of the following:

- (Device view) Select **NAT > Translation Rules** from the Device Policy selector.
- (Policy view) Select **NAT (PIX/ASA/FWSM) > Translation Rules** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or right-click **Translation Rules** to create a new policy.

## Translation Exemptions (NAT 0 ACL)

Use the Translation Exemptions (NAT 0 ACL) tab of the Translation Rules page to view and specify rules that exempt traffic from address translation. Rules are evaluated sequentially in the order listed. The row number indicates the rule's position in the ordering of the list. You can use the Up Row and Down Row buttons to change the position of the selected rule.

The Add/Edit Translation Exemption (NAT-0 ACL) Rule dialog box is used to add and edit these rules. Refer to [Add/Edit Translation Exemption \(NAT-0 ACL\) Rule Dialog Box, page 23-20](#) for descriptions of the fields displayed in the table on this page.

**Note**

Translation exemptions are only supported by PIX, ASA and FWSM devices in router mode, and FWSM 3.2 devices in transparent mode. Other devices in transparent mode support only static translation rules.

#### Navigation Path

You can access the Translation Exemptions (NAT 0 ACL) tab from the [Translation Rules: PIX, FWSM, and pre-8.3 ASA, page 23-18](#) page.

## Add/Edit Translation Exemption (NAT-0 ACL) Rule Dialog Box

Use the Add/Edit Translation Exemption (NAT-0 ACL) Rule dialog box to define and edit translation exemption rules on PIX, FWSM and pre-8.3 ASA devices in router mode, and FWSM 3.2 devices in transparent mode.

### Navigation Path

You can access the Add/Edit Translation Exemption (NAT-0 ACL) Rule dialog box from the Translation Exemptions (NAT 0 ACL) tab. See [Translation Exemptions \(NAT 0 ACL\)](#), page 23-19 for more information.

### Field Reference

**Table 23-7 Add/Edit Translation Exemption (NAT-0 ACL) Rule Dialog Box**

| Element                     | Description                                                                                                                                                                                                                                                                                               |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Rule                 | If checked, the rule is enabled. Deselect this option to disable the rule without deleting it.                                                                                                                                                                                                            |
| Action                      | Select the action for this rule: <ul style="list-style-type: none"> <li>• exempt – The rule identifies traffic that is exempt from NAT.</li> <li>• do not exempt – The rule identifies traffic that is not exempt from NAT.</li> </ul>                                                                    |
| Original: Interface         | Enter the name of (or Select) the device interface to which the rule applies.                                                                                                                                                                                                                             |
| Original: Sources           | Enter IP addresses for (or Select) the source hosts and network objects to which the rule applies. Multiple entries must be separated by commas.<br><br>Note that this parameter is displayed in the Translation Exemptions (NAT 0 ACL) table under the column heading “Original Address.”                |
| Translated: Direction       | The rule can be applied to Inbound or Outbound traffic, as specified with this option.                                                                                                                                                                                                                    |
| Traffic flow: Destinations  | Enter IP addresses for (or Select) the destination hosts and network objects to which the rule applies. Multiple entries must be separated by commas.                                                                                                                                                     |
| Category                    | To assign the rule to a category, choose the category from this list. Categories can help identify rules and objects using labels and color-coding. See <a href="#">Using Category Objects</a> , page 6-12 for more information.<br><br><b>Note</b> No commands are generated for the Category attribute. |
| Description                 | Enter a description of the rule.                                                                                                                                                                                                                                                                          |
| Advanced button (FWSM only) | Click to open the <a href="#">Advanced NAT Options Dialog Box</a> , page 23-28 to configure advanced settings for this rule.                                                                                                                                                                              |

## Dynamic Rules Tab

Use the Dynamic Rules tab of the Translation Rules page to view and configure dynamic NAT and PAT rules. Rules are evaluated sequentially in the order listed. The row number indicates the rule's position in the ordering of the list. You can use the Up Row and Down Row buttons to change the position of the selected rule.

With dynamic NAT, internal IP addresses are dynamically translated using IP addresses from a pool of global addresses. With dynamic PAT, internal IP addresses are translated to a single mapped address by using dynamically assigned port numbers with the mapped address. Dynamic translations are often used to map local RFC 1918 IP addresses to addresses that are Internet-routable.

The Add/Edit Dynamic Translation Rule dialog box is used to add and edit these rules. Refer to [Add/Edit Dynamic Translation Rule Dialog Box, page 23-21](#) for descriptions of the fields displayed in the table on this page.

**Note**

Dynamic translation rules are only supported by PIX, ASA and FWSM devices in router mode, and FWSM 3.2 devices in transparent mode. Other devices in transparent mode support only static translation rules.

**Navigation Path**

You can access the Dynamic Rules tab from the Translation Rules page. For more information about the Translation Rules page, see [Translation Rules: PIX, FWSM, and pre-8.3 ASA, page 23-18](#).

**Note**

By default, only standard Dynamic Rule elements are displayed in this table. Additional columns for elements defined in the Advanced NAT Options dialog box can be displayed by right-clicking any column heading. (All columns are displayed by default on the [General Tab, page 23-30](#).)

| Element               | Description                                                                                                                                                                                                                             |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Rule           | If checked, the rule is enabled. Deselect this option to disable the rule without deleting it.                                                                                                                                          |
| Original: Interface   | Enter the name or Select the device interface to which the rule applies.                                                                                                                                                                |
| Original: Address     | Enter IP addresses for (or Select) the source hosts and network objects to which the rule applies. Multiple entries must be separated by commas.                                                                                        |
| Translated: Pool      | Enter (or Select) the ID number of the pool of addresses used for translation; clicking Select opens the <a href="#">Select Address Pool Dialog Box, page 23-22</a> .<br>Enter a value of zero to specify this as an identity NAT rule. |
| Translated: Direction | The rule can be applied to Inbound or Outbound traffic, as specified with this option.                                                                                                                                                  |
| Advanced button       | Click to open the <a href="#">Advanced NAT Options Dialog Box, page 23-28</a> to configure advanced settings for this rule.                                                                                                             |

### Select Address Pool Dialog Box

The Select Address Pool dialog box presents a list of global address pools; these pools are defined and managed via the [Address Pools, page 23-17](#). Use this dialog box to select an address pool for use by a dynamic translation rule, or a policy dynamic translation rule.

#### Navigation Path

You can access the Select Address Pool dialog box from the [Add/Edit Dynamic Translation Rule Dialog Box, page 23-21](#) when adding or editing a dynamic translation rule, or from the [Add/Edit Policy Dynamic Rules Dialog Box, page 23-24](#) when adding or editing a policy dynamic translation rule.

**Table 23-9 Select Address Pool Dialog Box**

| Element   | Description                                                         |
|-----------|---------------------------------------------------------------------|
| Pool ID   | The identification number of the address pool.                      |
| Interface | The name of the device interface to which the address pool applies. |

**Table 23-9** *Select Address Pool Dialog Box (Continued)*

| Element           | Description                                                                                                                                              |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Address Ranges | The IP addresses assigned to the pool; “interface” in this list indicates PAT is enabled on the specified Interface.                                     |
| Description       | The description provided for the address pool.                                                                                                           |
| Selected Row      | This field identifies the pool currently selected in the list. When you click OK to close the dialog box, this pool is assigned to the translation rule. |

## Policy Dynamic Rules Tab

Use the Policy Dynamic Rules tab of the Translation Rules page to view and configure dynamic translation rules based on source and destination addresses and services. Rules are evaluated sequentially in the order listed. The row number indicates the rule’s position in the ordering of the list. You can use the Up Row and Down Row buttons to change the position of the selected rule.

The Add/Edit Policy Dynamic Rule dialog box is used to add and edit these rules. Refer to [Add/Edit Policy Dynamic Rules Dialog Box, page 23-24](#) for a description of the fields displayed in the table on this page.

### Note

Policy dynamic rules are only supported by PIX, ASA and FWSM devices in router mode, and FWSM 3.2 devices in transparent mode. Other devices in transparent mode support only static translation rules.

### Navigation Path

You can access the Policy Dynamic Rules tab from the Translation Rules page. See [Translation Rules: PIX, FWSM, and pre-8.3 ASA, page 23-18](#) for more information.

### Note

By default, only standard Policy Dynamic Rule elements are displayed in this table. Additional columns for elements defined in the Advanced NAT Options dialog box can be displayed by right-clicking any column heading. (All columns are displayed by default on the [General Tab, page 23-30](#).)

| Translated: Pool           | Enter (or Select) the ID number of the pool of addresses used for translation; clicking Select opens the <a href="#">Select Address Pool Dialog Box, page 23-22</a> .<br><br>Enter a value of zero to specify this as an identity NAT rule.                                                              |
| Translated: Direction      | The rule can be applied to Inbound or Outbound traffic, as specified with this option.                                                                                                                                                                                                                   |
| Traffic flow: Destinations | Enter IP addresses for (or Select) the destination hosts and network objects to which the rule applies. Multiple entries must be separated by commas.                                                                                                                                                    |
| Traffic flow: Services     | Enter (or Select) the services to which the rule applies. Multiple entries must be separated by commas.                                                                                                                                                                                                  |
| Category                   | To assign the rule to a category, choose the category from this list. Categories can help identify rules and objects using labels and color-coding. See <a href="#">Using Category Objects, page 6-12</a> for more information.<br><br><b>Note</b> No commands are generated for the Category attribute. |

**Table 23-10 Add/Edit Policy Dynamic Rules Dialog Box (Continued)**

| Element         | Description                                                                                                                 |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------|
| Description     | Enter a description of the rule.                                                                                            |
| Advanced button | Click to open the <a href="#">Advanced NAT Options Dialog Box, page 23-28</a> to configure advanced settings for this rule. |

## Static Rules Tab

Use the Static Rules tab of the Translation Rules page to view and configure static translation rules for a security appliance or shared policy. Rules are evaluated sequentially in the order listed. The row number indicates the rule's position in the ordering of the list. You can use the Up Row and Down Row buttons to change the position of the selected rule.

With static translation, internal IP addresses are permanently mapped to a global IP address. These rules map a host address on a lower security-level interface to a global address on a higher security-level interface. For example, a static rule would be used for mapping the local address of a web server on a perimeter network to a global address that hosts on the outside interface would use to access the web server.

### Caution

The order of Static NAT rules on a security device is important, and Security Manager preserves this ordering during deployment. However, security appliances do not support in-line editing of Static NAT rules. This means that if you move, edit, or insert a rule anywhere above the end of the list, Security Manager will remove from the device all Static NAT rules that follow the new or modified rule, and then re-send the updated list from that point. Depending on the length of the list, this can require substantial overhead, and may result in traffic interruption. Whenever possible, add any new Static NAT rules to the end of the list.

The Add/Edit Static Rule dialog box is used to add and edit these rules. Refer to [Add/Edit Static Rule Dialog Box, page 23-26](#) for descriptions of the fields displayed in the table on this page.

### The “Nailed” Column in the Static Rules Table

In addition to the columns representing parameters specified in the [Add/Edit Static Rule Dialog Box, page 23-26](#), the Static Rules table displays a column labeled “Nailed.” This value is a product of device discovery; it cannot be changed in Security Manager.

The entry in the “Nailed” Column indicates whether TCP state tracking and sequence checking is skipped for the connection: true or false.

### Navigation Path

You can access the Static Rules tab from the Translation Rules page. See [Translation Rules: PIX, FWSM, and pre-8.3 ASA, page 23-18](#) for more information.

### Note

By default, only standard Static Rules elements are displayed in this table. Additional columns for elements defined in the Advanced NAT Options dialog box can be displayed by right-clicking any column heading. (All columns are displayed by default on the [General Tab, page 23-30](#).)

### Field Reference

**Table 23-11 Add/Edit Static Rule Dialog Box**

| Element                               | Description                                                                                                                                                                                                |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Rule                           | If checked, the rule is enabled. Deselect this option to disable the rule without deleting it.                                                                                                             |
| Translation Type                      | Select the type of translation for this rule: NAT or PAT.                                                                                                                                                  |
| Original Interface                    | Enter (or Select) the device interface connected to the host or network with original addresses to be translated.                                                                                          |
| Original Address                      | Enter (or Select) the source address to be translated.                                                                                                                                                     |
| Translated Interface                  | Enter (or Select) the interface on which the translated addresses are to be used.<br><br>To specify this as an identity NAT rule, enter the same interface in both this and the Original Interface fields. |
| Use Interface IP/Use Selected Address | Specify the address used for the Translated Interface: select Use Interface IP (address), or select Use Selected Address and enter an address, or Select a network/host object.                            |
| Enable Policy NAT                     | Select this option to enable Policy NAT for this translation rule.                                                                                                                                         |
| Dest Address                          | If Policy NAT is enabled, specify the destination addresses of the hosts or networks to which the rule applies.                                                                                            |

**Table 23-11 Add/Edit Static Rule Dialog Box (Continued)**

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Services        | <p>If Policy NAT is enabled, enter or Select the Services to which the rule applies.</p> <p><b>Note</b> For Static Policy NAT, IP is the only Service that can be specified.</p> <p>The syntax for service and service-object specification is:<br/> <code>{tcp   udp   tcp&amp;udp}/{source_port_number   port_list_object}/<br/> {destination_port_number   port_list_object}</code></p> <p>Note that if you enter only one port parameter, it is interpreted as the destination port (with a source port of “any”). For example, <b>tcp/4443</b> means tcp, source port any, destination port 4443, while <b>tcp/4443/Default Range</b> means tcp, source port 4443, and destination port Default Range (generally 1-65535).</p> <p>As with all text-entry fields, Security Manager may display auto-complete options. For example, if you type <b>tcp/</b> in this field, an auto-complete list of all Port Lists objects defined in Security Manager is displayed. This list will include system-generated objects such as DEFAULT RANGE, HTTPS and WEBPORTS.</p> <p>Refer to <a href="#">Configuring Port List Objects, page 6-87</a> for more information about Port Lists, and <a href="#">Configuring Service Objects, page 6-89</a> for more information about defining Services.</p> |
| Protocol        | If PAT is the selected Translation Type, select the protocol, TCP or UDP, to which the rule applies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Original Port   | <p>If PAT is the selected Translation Type, enter the port number to be translated.</p> <p>Note that this parameter is displayed in the Static Rules table under the column heading “Local Port.”</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Translated Port | <p>If PAT is the selected Translation Type, enter the port number to which the original port number will be translated.</p> <p>Note that this parameter is displayed in the Static Rules table under the column heading “Global Port.”</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Category        | <p>To assign the rule to a category, choose the category from this list. Categories can help identify rules and objects using labels and color-coding. See <a href="#">Using Category Objects, page 6-12</a> for more information.</p> <p><b>Note</b> No commands are generated for the Category attribute.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Description     | Enter a description of the rule.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Advanced button | Click to open the <a href="#">Advanced NAT Options Dialog Box, page 23-28</a> to configure advanced settings for this rule.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

### Edit Translated Address Dialog Box

Use the Edit Translated Address dialog box to change just the translated address assigned to a static translation rule. The translated address is the address to which the original address is changed. The interface’s IP address can be used, or you can enter a specific IP address. See [Static Rules Tab, page 23-25](#) for more information about static rules and translated addresses.

For detailed information on editing firewall rules cells, see [Editing Rules, page 12-9](#).

#### Navigation Path

Right-click the Translated Address cell in the Static Rules table (on the NAT > Translation Rules page) and choose **Edit Translated Address**.

### Advanced NAT Options Dialog Box

Use the Advanced NAT Options dialog box to configure the advanced connection settings—DNS Rewrite, Maximum TCP and Maximum UDP Connections, Embryonic Limit, Timeout (PIX 6.x), and Randomize Sequence Number—for NAT and Policy NAT. You can also configure these options for Translation Exemption (NAT 0 ACL) rules on an FWSM.

#### Navigation Path

You can access the Advanced NAT Options dialog box by clicking the **Advanced** button when adding or editing a translation rule. See the following topics for more information:

- [Add/Edit Translation Exemption \(NAT-0 ACL\) Rule Dialog Box, page 23-20](#)
- [Add/Edit Dynamic Translation Rule Dialog Box, page 23-21](#)
- [Add/Edit Policy Dynamic Rules Dialog Box, page 23-24](#)
- [Add/Edit Static Rule Dialog Box, page 23-26](#)

## Field Reference

Table 23-12 Advanced NAT Options Dialog Box

| Element                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Translate the DNS replies that match the translation rule | <p>If checked, the security appliance rewrites DNS replies so an outside client can resolve the name of an inside host using an inside DNS server, and vice versa. For instance, if your NAT rule includes the real address of a host with an entry in a DNS server, and the DNS server is on a different interface from a client, then the client and the DNS server need different addresses for the host: one needs the mapped address and one needs the real address. This option rewrites the address in the DNS reply to the client.</p> <p>As an example, assume an inside web server, <code>www.example.com</code>, has the IP address <code>192.168.1.1</code>, which is translated to <code>10.1.1.1</code> on the outside interface of the appliance. An outside client sends a DNS request to an inside DNS server, which will resolve <code>www.example.com</code> to <code>192.168.1.1</code>. When the reply comes to the security appliance with DNS Rewrite enabled, the security appliance will translate the IP address in the payload to <code>10.1.1.1</code>, so that the outside client will get the correct IP address.</p> <p>Note that the mapped host needs to be on the same interface as either the client or the DNS server. Typically, hosts that need to allow access from other interfaces use a static translation, so this option is more likely to be used with a static rule.</p> |
| Max TCP Connections per Rule                              | Enter the maximum number of TCP connections allowed; valid values are 0 through 65,535. If this value is set to zero, the number of connections is unlimited.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Max UDP Connections per Rule                              | Enter the maximum number of UDP connections allowed; valid values are 0 through 65,535. If this value is set to zero, the number of connections is unlimited.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Max Embryonic Connections                                 | <p>Enter the number of embryonic connections allowed to form before the security appliance begins to deny these connections. An embryonic connection is a connection request that has not finished the necessary handshake between source and destination. Set this limit to prevent attack by a flood of embryonic connections. Valid values are 0 through 65,535. If this value is set to zero, the number of connections is unlimited.</p> <p>Any positive value enables the TCP Intercept feature. TCP Intercept protects inside systems from a DoS attack perpetrated by flooding an interface with TCP SYN packets. When the embryonic limit has been surpassed, the TCP Intercept feature intercepts TCP SYN packets from clients to servers on a higher security level. SYN cookies are used during the validation process and help to minimize the amount of valid traffic being dropped. Thus, connection attempts from unreachable hosts will never reach the server.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                   |

Table 23-12 Advanced NAT Options Dialog Box (Continued)

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Timeout                   | For PIX 6.x devices, enter a timeout value for this translation rule, in the format <i>hh:mm:ss</i> . This value overrides the default translation timeout specified in Platform > Security > Timeouts, unless this value is 00:00:00, in which case translations matching this rule use the default translation timeout (specified in Platform > Security > Timeouts).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Randomize Sequence Number | <p>If checked, the security appliance randomizes the sequence numbers of TCP packets. Each TCP connection has two Initial Sequence Numbers (ISNs): one generated by the client and one generated by the server. The security appliance randomizes the ISN of the TCP SYN in both the inbound and outbound directions. Randomizing the ISN of the protected host prevents an attacker from predicting the next ISN for a new connection and potentially hijacking the new session.</p> <p>Disable this feature only if:</p> <ul style="list-style-type: none"> <li>• Another in-line security appliance is also randomizing initial sequence numbers and data is being scrambled.</li> <li>• You are using eBGP multi-hop through the security appliance, and the eBGP peers are using MD5. Randomization breaks the MD5 checksum.</li> <li>• You are using a WAAS device which requires that the security appliance not randomize the sequence numbers of connections.</li> </ul> <p>Disabling this option opens a security hole in the security appliance.</p> |

## General Tab

Use the General tab of the Translation Rules page to view a summary of all translation rules defined for the current device or shared policy. The translation rules are listed in the order that they will be evaluated on the device.

### Note

The General tab is only visible for PIX, ASA and FWSM devices in router mode, and FWSM 3.2 devices in transparent mode. Other devices in transparent mode support only static translation rules and do not need to display summary information.

### Navigation Path

You can access the General tab from the Translation Rules page. See [Translation Rules: PIX, FWSM, and pre-8.3 ASA, page 23-18](#) for more information.

**Table 23-13** *General Tab - Translation Rules Summary Table*

| Element                 | Description                                                                                                                                                                                                                                                                                                              |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Note</b>             | Hatching (a series of slanted lines) across an entry in the table indicates that rule is currently disabled. (See Enable Rule in <a href="#">Add/Edit Dynamic Translation Rule Dialog Box, page 23-21</a> for information about enabling and disabling these rules.)                                                     |
| No.                     | Rules are evaluated sequentially in the order listed. This number indicates the rule's position in the ordering of the list.                                                                                                                                                                                             |
| Type                    | The type of translation rule; for example, Static, Dynamic, Exemption, etc.                                                                                                                                                                                                                                              |
| Action                  | Displays "exempt" if the rule is exempt from NAT.                                                                                                                                                                                                                                                                        |
| Original Interface      | The ID of the device interface to which the rule is applied.                                                                                                                                                                                                                                                             |
| Original Address        | The object names or IP addresses of the source hosts and networks to which the rule applies.                                                                                                                                                                                                                             |
| Local Port              | The port number supplied by the host or network (for static PAT).                                                                                                                                                                                                                                                        |
| Translated Pool         | The ID number of the address pool used for translation.                                                                                                                                                                                                                                                                  |
| Translated Interface    | The interface on which the translated addresses are to be used.                                                                                                                                                                                                                                                          |
| Translated Address      | The translated addresses.                                                                                                                                                                                                                                                                                                |
| Global Port             | The port number to which the original port number will be translated (for static PAT).                                                                                                                                                                                                                                   |
| Destination             | The object names and IP addresses of the destination hosts or networks to which the rule applies.                                                                                                                                                                                                                        |
| Protocol                | The protocol to which the rule applies.                                                                                                                                                                                                                                                                                  |
| Service                 | The services to which the rule applies.                                                                                                                                                                                                                                                                                  |
| Direction               | The traffic direction (Inbound or Outbound) on which the rule is applied.                                                                                                                                                                                                                                                |
| DNS Rewrite             | Whether the DNS Rewrite option is enabled: Yes or No. This option is set in the <a href="#">Advanced NAT Options Dialog Box, page 23-28</a> .                                                                                                                                                                            |
| Maximum TCP Connections | The maximum number of TCP connections allowed to connect to the statically translated IP address. If zero, the number of connections is unlimited. This option is set in the <a href="#">Advanced NAT Options Dialog Box, page 23-28</a> .                                                                               |
| Embryonic Limit         | The number of embryonic connections allowed to form before the security appliance begins to deny these connections. If zero, the number of connections is unlimited. A positive number enables the TCP Intercept feature.<br><br>This option is set in the <a href="#">Advanced NAT Options Dialog Box, page 23-28</a> . |

Table 23-13 General Tab - Translation Rules Summary Table (Continued)

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maximum UDP Connections   | The maximum number of UDP connections allowed to connect to the statically translated IP address. If zero, the number of connections is unlimited. This option is set in the <a href="#">Advanced NAT Options Dialog Box</a> , page 23-28.                                                                                                                                               |
| Timeout                   | For PIX 6.x devices, this is the timeout value for a static translation rule. This value overrides the default translation timeout specified in Platform > Security > Timeouts. A Timeout value of 00:00:00 here means that translations matching this rule should use the default translation timeout specified in Platform > Security > Timeouts.                                      |
| Randomize Sequence Number | Whether the security appliance will randomize the sequence number of TCP packets: Yes or No. This option is set in the <a href="#">Advanced NAT Options Dialog Box</a> , page 23-28, and is enabled by default.                                                                                                                                                                          |
| Category                  | The category to which the rule is assigned. Categories use labels and color-coding to help identify rules and objects. See <a href="#">Using Category Objects</a> , page 6-12 for more information.<br><b>Note</b> No commands are generated for the Category attribute.                                                                                                                 |
| Description               | The description of the rule, if provided.                                                                                                                                                                                                                                                                                                                                                |
| Last Ticket(s)            | Shows the ticket(s) associated with last modification to the rule. You can click the ticket ID in the Last Ticket(s) column to view details of the ticket and to navigate to the ticket. If linkage to an external ticket management system has been configured, you can also navigate to that system from the ticket details (see <a href="#">Ticket Management Page</a> , page 11-51). |

## Configuring NAT on ASA 8.3+ Devices

The following section describes configuring network address translation on version 8.3 or later ASA devices:

- [Translation Rules: ASA 8.3+](#), page 23-32
  - [Add and Edit NAT Rule Dialog Boxes](#), page 23-35
  - [Add or Edit Network/Host Dialog Box: NAT Tab](#), page 23-41
- [Per-Session NAT Rules: ASA 9.0\(1\)+](#)

See [Configuring NAT on PIX, FWSM, and pre-8.3 ASA Devices](#), page 23-17 for information about configuring NAT on other security appliances. Refer to [About “Simplified” NAT on ASA 8.3+ Devices](#), page 23-3 for general information about NAT rules, and the changes to NAT configuration implemented on the ASA 8.3.

### Translation Rules: ASA 8.3+

Use the Translation Rules page to manage network address translation (NAT) rules on the selected ASA 8.3+ device. See [NAT Policies on Security Devices](#), page 23-15 for information about configuring Translation Rules on other security devices.

Two types of NAT rules are displayed in this table: “manual” rules added by you and any other users, and “automatic” rules generated and applied by Security Manager when an object with NAT properties is assigned to the device. These are referred to as “NAT rules” and “Network Object NAT rules,” respectively.

### Some Features of the Translation Rules Table

This Translation Rules table is a standard Security Manager rules table, as described in [Using Rules Tables, page 12-7](#). For example, you can move, show and hide columns; you can re-order the manual rules; and you can right-click certain table cells to edit that parameter. In addition, the following features are specific to this Translation Rules table:

- All rules are assigned to one of three pre-defined sections in the table:
  - **NAT Rules Before** – These are rules you or another user have “manually” defined on the device. You can specify that a rule be added to this section by clicking the section heading before adding the rule, although if you do not specify a section, the new rule will be added to this section by default.
  - **Network Object NAT Rules** – These are rules generated and ordered automatically by Security Manager when network objects that include NAT properties are assigned to the device. See [Add or Edit Network/Host Dialog Box: NAT Tab, page 23-41](#) for information about assigning NAT properties to objects. See the section “The NAT Table” in [About “Simplified” NAT on ASA 8.3+ Devices, page 23-3](#) for information about how these rules are ordered.

---

**Note** This section is not displayed in the Translation Rules table in Policy View because these rules are device-specific.

---

- **NAT Rules After** – These also are rules you or another user have manually defined on the device. You can specify that a rule is added to this section by clicking the section heading before adding the rule.

The NAT rules listed in this table are processed on a first-match basis; therefore, order is important. Providing a manual section both before and after the automatic rules lets you ensure all your rules are in the appropriate order, since you can re-order rules only within their section. The rules in each section take precedence over the rules in the section below it. For example, the rules in the top, “Before” section take precedence over the rules in the Network Object NAT section, and so on.

- The type of each rule—Static, Dynamic PAT, or Dynamic NAT and PAT—is indicated visually in the table by presenting (*S*), (*DP*), or (*DNP*) in blue following the Source parameter in the “Translated” column.
- A Bi-directional rule is a static rule that actually consists of two paired rules, one each for outgoing and incoming translation of the specified source and destination values. Each Bi-directional rule entry in the rules table is presented as two lines.

For example, if Bi-directional is chosen when you create a static rule with Host1 in the Source field and Host2 in the Translated field, two lines are added to the rules table: one with Host1 being translated to Host2, and one with Host2 being translated to Host1.

- Standard rules table topics:
  - [Using Rules Tables, page 12-7](#)

- [Filtering Tables, page 1-45](#)
- [Table Columns and Column Heading Features, page 1-46](#)

### Navigation Path

- (Device view) Select **NAT > Translation Rules** from the Device Policy selector.
- (Policy view) Select **NAT (PIX/ASA/FWSM) > Translation Rules** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or right-click **Translation Rules** to create a new policy.

The Translation Rules page is displayed. Note that in Policy View, the Network Object NAT Rules section is not displayed because those rules are device-specific.

### Adding, Editing and Deleting Rules

To **add** a NAT rule:

1. Select the heading of the section to which the rule is to be added. If you do not select a heading, the rule will be added to *NAT Rules Before* by default.
2. Open the Add NAT Rule dialog box: either click the Add Row button at the bottom of the table, or right-click anywhere in the table (except on an existing rule entry) and choose Add Row from the pop-up menu.
3. Define the rule and then click OK to close the dialog box, adding the rule to the table.

To **edit** a NAT rule:

1. Open the Edit NAT Rule dialog box for the desired rule: either select the rule in the NAT rules table and then click the Edit Row button at the bottom of the table, or simply right-click the desired rule entry and choose Edit Row from the pop-up menu.
2. Edit the rule and then click OK to close the dialog box.

See [Add and Edit NAT Rule Dialog Boxes, page 23-35](#) for a complete description of the Add NAT Rule dialog box.

To **delete** a NAT rule, select the rule in the table and click the Delete Row button at the bottom of the table, or simply right-click the desired rule entry and choose Delete Row from the pop-up menu.

#### Note

To remove a Network Object NAT rule from this table, you must uncheck the Add Automatic Address Translation NAT Rule option, or change the device to which the rule is assigned, in the related Edit Network Host dialog box. See [Add or Edit Network/Host Dialog Box: NAT Tab, page 23-41](#) for additional information.

### Enabling and Disabling Rules

You can disable one or more consecutive rules without removing them from the table, as follows:

1. Select the rule(s) to be disabled. If selecting a contiguous block of rules, click the first and then Shift-click the last rule of the block.
2. Right-click a selected rule, and choose **Disable** from the pop-up menu.

Disabled rules are grayed-out in the table.

To re-enable one or one or more consecutive disabled rules, repeat this process, choosing **Enable** from the pop-up menu.

## Add and Edit NAT Rule Dialog Boxes

Use the Add NAT Rule dialog box to add a NAT rule to the selected ASA 8.3+ device; this dialog box is not available on earlier-version ASAs, nor on PIX or FWSM devices. Refer to [Configuring NAT on PIX, FWSM, and pre-8.3 ASA Devices, page 23-17](#) for information about adding and editing NAT rules on those devices.

### Note

Except for their titles, the Add NAT Rule and Edit NAT Rule dialog boxes are identical, and the following descriptions apply to both.

### Navigation Path

To add a rule, select the section to which you want the rule added (NAT Rules Before or NAT Rules After), and then click the Add Row button below the rules table, or right-click anywhere inside the table and choose **Add Row** to open the Add NAT Rule dialog box. Note that if you do not select a section, the new rule is added to the NAT Rules Before section.

To edit a rule, select the rule and click the Edit Row button, or simply right-click the rule and choose the Edit Row command, to open the Edit NAT Rule dialog box for that rule.

|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source NAT Type                           | <p>The type of translation rule you are creating:</p> <ul style="list-style-type: none"> <li>• <b>Static</b> – Provides static assignment of real addresses to mapped addresses.</li> <li>• <b>Dynamic PAT (Hide)</b> – Provides dynamic assignment of multiple local addresses to a single global IP address and a unique port number, in effect “hiding” the local addresses behind the one global address.</li> <li>• <b>Dynamic NAT and PAT</b> – Provides dynamic assignment of real addresses to mapped addresses, and real ports to mapped ports.</li> </ul> <p>Selecting this option adds the PAT Pool Address Translation options to the dialog box. On devices operating in routed mode, this option also provides the fallthrough option described below.</p> <p><b>Note</b> This selection applies only to the specified source translation; destination translation is always static.</p>                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Source Translation</b>                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Original Source                           | The source address the NAT rule will translate. If this is a range or network, all addresses in the range or network are translated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Translated Source<br>Address<br>Interface | <p>Whether the translation is based on an address or an interface on the device. Select either:</p> <ul style="list-style-type: none"> <li>• <b>Address</b> – Translate the original address using the Networks/Hosts object specified in the Translated Source field. This entry represents the pool of translation addresses: enter or Select the desired Networks/Hosts; defaults to the Original Source (which will produce an Identity NAT rule).</li> <li>• <b>Interface</b> – Translate the original address based on the interface specified in the Destination Interface field.</li> </ul> <p>For port address translation based on this interface, be sure to configure the options in the Service Translation section (in the Advanced panel of this dialog box).</p> <p>If the Destination Interface is not defined, the Address/Interface selection reverts to Address and the Original Source is inserted into the Address field. This produces an Identity NAT rule, meaning the specified address(es) are translated to themselves (effectively not translated); Identity NAT applies to outbound connections only.</p> <p><b>Note</b> These options are not available when Dynamic NAT and PAT is the selected Type, nor are they available on devices operating in transparent mode.</p> |

Table 23-14 Add and Edit NAT Rule Dialog Boxes (Continued)

| Element                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PAT Pool Address Translation | <p>This option is available when Dynamic NAT and PAT is the selected Type. The related parameters let you specify a “pool” of IP addresses to be used for specifically for port address translation, as well as change the algorithm used for PAT mapping. Refer to <a href="#">PAT Pools and Round Robin Allocation, page 23-40</a> for additional information about these features.</p> <p>Check the PAT Pool Address Translation box to enable the following options:</p> <ul style="list-style-type: none"> <li>• <b>Address or Interface</b> – Select Address to indicate that the PAT Pool Address field contains networks/hosts (or networks/hosts objects) for use as the PAT pool. Select Interface to provide a Fallthrough Interface.</li> <li>• <b>Address</b> – Enter or Select the desired Networks/Hosts or desired Interface according to your Address or Interface selection above.</li> <li>• <b>Use Round Robin Allocation</b> – Check this box to map addresses/ports using a “round-robin” approach. See <a href="#">PAT Pools and Round Robin Allocation, page 23-40</a> for more information about this option.</li> <li>• <b>Extended PAT Table</b> (Available for ASA 8.4(3) and later, not including 8.5(1) or 8.6(1)) - Check this box to enable extended PAT. Extended PAT uses 65535 ports per service, as opposed to per IP address, by including the destination address and port in the translation information. Normally, the destination port and address are not considered when creating PAT translations, so you are limited to 65535 ports per PAT address. For example, with extended PAT, you can create a translation of 10.1.1.1:1027 when going to 192.168.1.7:23 as well as a translation of 10.1.1.1:1027 when going to 192.168.1.7:80. This option is available for ASA 8.4(3) and later, not including 8.5(1) or 8.6(1).</li> <li>• <b>Flat Port Range</b> (Available for ASA 8.4(3) and later, not including 8.5(1) or 8.6(1)) - Check this box to enable use of the entire 1024 to 65535 port range when allocating ports. When choosing the mapped port number for a translation, the ASA uses the real source port number if it is available. However, without this option, if the real port is not available, by default the mapped ports are chosen from the same range of ports as the real port number: 1 to 511, 512 to 1023, and 1024 to 65535. To avoid running out of ports at the low ranges, configure this setting. To use the entire range of 1 to 65535, also select <b>Include Reserve Ports</b>.</li> <li>• <b>Include Reserve Ports</b> (Available for ASA 8.4(3) and later, not including 8.5(1) or 8.6(1)) - Check this box to include the reserve ports, 1-1023, in the PAT range.</li> </ul> |

| These service objects represent a service protocol (TCP or UDP), and one or more ports. The mapping of original ports to translated port is circular. That is, the first original value is mapped to the first translated value, and the second original value is mapped to the second translated value, and so on until all original values are translated. If the pool of translated port is exhausted before that point, mapping continues using the first translated value again. See <a href="#">Understanding and Specifying Services and Service and Port List Objects</a> , page 6-86 for information about configuring service objects. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Note</b> Service Translation and the following <b>Translate DNS replies that match this rule</b> option cannot be used together.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Translate DNS replies that match this rule           | <p>When checked, addresses embedded in DNS replies that match this rule are rewritten.</p> <p>For DNS replies traversing from a mapped interface to a real interface, the Address (or “A”) record is rewritten from the mapped value to the real value. Conversely, for DNS replies traversing from a real interface to a mapped interface, the A record is rewritten from the real value to the mapped value. Note that DNS inspection must be enabled to support this functionality.</p>                                                                                                                                                                                                                                                                                                                             |
| Fallthrough to Interface PAT (Destination Interface) | <p>When checked, dynamic PAT back-up is enabled. When the pool of dynamic NAT addresses is depleted, port address translation is performed, using the address pool specified in the Use Address field. This option is available only when Dynamic NAT and PAT is the chosen Type on devices operating in routed mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| IPv6                                                 | <p>When selected, the IPv6 address of the interface is used.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Net to net mapping of IPv4 to IPv6                   | <p>When checked, translates the first IPv4 address to the first IPv6 address, the second to the second, and so on. Without this option, the IPv4-embedded method is used where the 32-bits of the IPv4 address is embedded after the IPv6 prefix. For a one-to-one translation, you must select this option.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Do not proxy ARP on Destination Interface            | <p>Check this box to disable proxy ARP on the specified Destination Interface. This option is available only when Static is the chosen rule Type.</p> <p><b>Note</b> This option is available on ASA 8.4.2+ devices, only when Bidirectional is the chosen Direction.</p> <p>By default, all NAT rules include proxy ARP on the egress interface. A NAT Exempt rule is used to bypass NAT for both ingress and egress traffic, relying on route look-up to locate the egress interface. Thus, Proxy ARP should be disabled for NAT Exempt rules. (The NAT Exempt rules always take priority and appear above all other NAT rules in the Translation Rules table.)</p> <p><b>Note</b> You also can disable Proxy ARP on individual interfaces, as described in <a href="#">Configuring No Proxy ARP, page 54-1</a>.</p> |
| Perform route lookup for Destination Interface       | <p>If this option is selected, the egress interface is determined using route look-up instead of using the specified Destination Interface. Be sure this box is checked for a NAT Exempt rule. This option is supported only for Static Identity NAT.</p> <p><b>Note</b> This option is available on ASA 8.4.2+ devices, only when Bidirectional is the chosen Direction. The option is not available on devices operating in transparent mode.</p>                                                                                                                                                                                                                                                                                                                                                                    |

**Table 23-14 Add and Edit NAT Rule Dialog Boxes (Continued)**

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Unidirectional | This feature lets you configure a static NAT rule in a single direction only; or dual rules, one each for both directions (forward and reverse).<br>When selected, a single static NAT is created, as specified by the other options in this dialog box. Dynamic rules are uni-directional by default.<br>If deselected, two linked static NAT rules are created, encompassing both directions of the translation, as specified by the other options in this dialog box. Note that each bi-directional rule entry in the rules table consists of two lines. |
| Description    | (Optional) Provide a description of the rule.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Category       | (Optional) Choose a category to assign to the rule. Categories can help you organize and identify rules and objects; see <a href="#">Using Category Objects, page 6-12</a> for more information.<br><br><b>Note</b> This option is not available when Dynamic NAT and PAT is the chosen rule Type.                                                                                                                                                                                                                                                          |

## PAT Pools and Round Robin Allocation

Adaptive Security Appliances, version 8.4.2 and later, include two features that let you alter how port address translation (PAT) occurs: you can explicitly define a pool of IP addresses specifically for PAT, and you can select a “round robin” algorithm for port allocation during PAT.

These features simplify configuration of large numbers of PAT addresses, and help prevent a large number of connections from a single PAT address, which can appear to be part of a DoS attack.

### Explicit PAT Pool Definition

Prior to version 8.4.2, when you defined a Dynamic NAT and PAT rule, you provided a “pool” of IP addresses (in the Translated Source field of the Add/Edit NAT Rule dialog boxes) to be used for translation. This pool could consist of individual IP addresses, ranges of addresses, Networks/Hosts objects, or Network/Host group objects, and combinations thereof.

Ranges and objects with more than one IP address were considered to be in the “NAT Pool,” while individual IP addresses and group objects consisting of one or more individual addresses were considered to be part of the “PAT Pool.”

Address translation on the device would work its way through the NAT Pool until all available addresses were exhausted. Port address translation would then begin using the PAT Pool—assigning ports on the first IP address in the PAT Pool until all ports (approximately 64,000) are assigned, then assigning ports on the next address in the pool, and so on. When all ports are fully subscribed on all IP addresses in the PAT Pool, no further translation could occur.

On version 8.4.2 and later ASA devices, you can explicitly define a separate PAT Pool for a Dynamic NAT and PAT rule. If you do so, the first collection of addresses (defined in the Translated Source field) is considered the NAT Pool, while the PAT Pool addresses are specified in the PAT Pool Address Translation field.

#### Note

If you do not explicitly specify a PAT Pool, address translation takes place as described for pre-8.4.2 devices.

Refer to [Add and Edit NAT Rule Dialog Boxes, page 23-35](#) for more information about the defining translation rules.

### Round Robin Port Assignment

On version 8.4.2 and later ASA devices, you also can specify an alternate method of port assignment during PAT processing. As mentioned earlier, PAT port numbers are assigned to a single IP address in succession until the final port number is assigned, and then the process begins again with the next available IP address in the pool.

However, a new parameter on 8.4.2 and later devices—Use Round Robin Allocation for PAT Pool—lets you specify “round robin” cycling through available IP addresses and port numbers. This method assigns an address/port combination using each successive address in the pool; it then uses the first address again with a different port, proceeds to the second address again, and so on.

Further, the round-robin algorithm incorporates two additional principles it will attempt to adhere to when assigning address/port combinations during PAT processing:

- If a specific source-to-destination mapping already exists, the algorithm attempts to use the existing translation for the new connection. If this is not possible (for example, when all ports for that IP address have been exhausted), the algorithm proceeds with standard round-robin cycling.
- If possible, the original source port number is used as the mapped port number. That is, if the port number of the address/port combination to be translated is 4904, for example, and 4904 is available with the next IP address in the PAT Pool, the translated address will be *PAT\_address/4904*. Note if this is not possible (that port is not available with the next PAT address), the algorithm proceeds with standard round-robin cycling.

#### Note

If you do not explicitly specify Round Robin Allocation, port-allocation cycling occurs as described for pre-8.4.2 devices.

## Add or Edit Network/Host Dialog Box: NAT Tab

Use the NAT tab in any of the dialog boxes used to add or edit host, network, or address range objects to create or update object NAT rules. This NAT configuration is used only for ASA 8.3+ devices; if you use the object on any other type of device, the NAT configuration is ignored.

The NAT configuration is created as a device override and is not kept in the global object. Therefore, you must select the **Allow Value Override per Device** option if you configure these NAT options. (This option is selected automatically when you close the dialog box.)

This topic describes the fields on the NAT tab. For information about the fields on the General tab, see [Add or Edit Network/Host Dialog Box, page 6-77](#).

### Navigation Path

Select the NAT tab on the [Add or Edit Network/Host Dialog Box](#) when creating or editing a host, network, or address range object.

| Element                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PAT Pool Address Translation | <p>This option is available when Dynamic NAT and PAT is the selected Type. The related parameters let you specify a “pool” of IP addresses to be used for specifically for port address translation, as well as change the algorithm used for PAT mapping. Refer to <a href="#">PAT Pools and Round Robin Allocation, page 23-40</a> for additional information about these features.</p> <p>Check the PAT Pool Address Translation box to enable the following options:</p> <ul style="list-style-type: none"> <li>• <b>Use Address or Use Interface</b> – Select Use Address to indicate that the PAT Pool Address field contains networks/hosts (or networks/hosts objects) for use as the PAT pool. Select Use Interface to provide a Fallthrough Interface.</li> <li>• <b>PAT Pool Address</b> – Enter or Select the desired Networks/Hosts or desired Interface according to your Address or Interface selection above.</li> <li>• <b>Use Round Robin Allocation for PAT Pool</b> – Check this box to map addresses/ports using a “round-robin” approach. See <a href="#">PAT Pools and Round Robin Allocation, page 23-40</a> for more information about this option.</li> <li>• <b>Extended PAT Table</b> (Available for ASA 8.4(3) and later, not including 8.5(1) or 8.6(1)) - Check this box to enable extended PAT. Extended PAT uses 65535 ports per service, as opposed to per IP address, by including the destination address and port in the translation information. Normally, the destination port and address are not considered when creating PAT translations, so you are limited to 65535 ports per PAT address. For example, with extended PAT, you can create a translation of 10.1.1.1:1027 when going to 192.168.1.7:23 as well as a translation of 10.1.1.1:1027 when going to 192.168.1.7:80. This option is available for ASA 8.4(3) and later, not including 8.5(1) or 8.6(1).</li> <li>• <b>Flat Port Range</b> (Available for ASA 8.4(3) and later, not including 8.5(1) or 8.6(1)) - Check this box to enable use of the entire 1024 to 65535 port range when allocating ports. When choosing the mapped port number for a translation, the ASA uses the real source port number if it is available. However, without this option, if the real port is not available, by default the mapped ports are chosen from the same range of ports as the real port number: 1 to 511, 512 to 1023, and 1024 to 65535. To avoid running out of ports at the low ranges, configure this setting. To use the entire range of 1 to 65535, also select <b>Include Reserve Ports</b>.</li> <li>• <b>Include Reserve Ports</b> (Available for ASA 8.4(3) and later, not including 8.5(1) or 8.6(1)) - Check this box to include the reserve ports, 1-1023, in the PAT range.</li> </ul> |

| Translate DNS replies that match this rule                                                                                                | <p>When checked, addresses embedded in DNS replies that match this rule are rewritten.</p> <p>For DNS replies traversing from a mapped interface to a real interface, the Address (or "A") record is rewritten from the mapped value to the real value. Conversely, for DNS replies traversing from a real interface to a mapped interface, the A record is rewritten from the real value to the mapped value. Note that DNS inspection must be enabled to support this functionality.</p> <p><b>Note</b> This option and Service Translation cannot be used together.</p>                                                                                                                         |
| Fallthrough to Interface PAT (Destination Interface)                                                                                      | When checked, dynamic PAT back-up is enabled. When the pool of dynamic NAT addresses is depleted, port address translation is performed, using the address pool specified in the Use Address field. This option is available only when Dynamic NAT and PAT is the chosen Type on devices operating in routed mode.                                                                                                                                                                                                                                                                                                                                                                                 |
| IPv6                                                                                                                                      | When selected, the IPv6 address of the interface is used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Net to net mapping of IPv4 to IPv6                                                                                                        | When checked, translates the first IPv4 address to the first IPv6 address, the second to the second, and so on. Without this option, the IPv4-embedded method is used where the 32-bits of the IPv4 address is embedded after the IPv6 prefix. For a one-to-one translation, you must select this option.                                                                                                                                                                                                                                                                                                                                                                                          |
| Do not proxy ARP on Destination Interface                                                                                                 | <p>Check this box to disable proxy ARP on the specified Destination Interface. This option is available only when Static is the chosen rule Type.</p> <p>By default, all NAT rules include proxy ARP on the egress interface. A NAT Exempt rule is used to bypass NAT for both ingress and egress traffic, relying on route look-up to locate the egress interface. Thus, Proxy ARP should be disabled for NAT Exempt rules. (The NAT Exempt rules always take priority and appear above all other NAT rules in the Translation Rules table.)</p> <p><b>Note</b> You also can disable Proxy ARP on individual interfaces, as described in <a href="#">Configuring No Proxy ARP, page 54-1</a>.</p> |

**Table 23-15** Network/Host Dialog Box NAT Tab (Continued)

| Element                                        | Description                                                                                                                                                                                                                                                                                                                                         |
|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Perform route lookup for Destination Interface | <p>If this option is selected, the egress interface is determined using route look-up instead of using the specified Destination Interface. Be sure this box is checked for a NAT Exempt rule. This option is supported only for Static Identity NAT.</p> <p><b>Note</b> This option is not available on devices operating in transparent mode.</p> |

## Per-Session NAT Rules: ASA 9.0(1)+

Use the Per-Session NAT Rules page to configure per-session PAT rules on the selected ASA 9.0(1)+ device. By default, all TCP PAT traffic and all UDP DNS traffic uses per-session PAT. You can configure per-session rules to use multi-session PAT for specific traffic.

### Per-Session PAT vs. Multi-Session PAT (Version 9.0(1) and Later)

The per-session PAT feature improves the scalability of PAT and, for clustering, allows each member unit to own PAT connections; multi-session PAT connections have to be forwarded to and owned by the master unit. At the end of a per-session PAT session, the ASA sends a reset and immediately removes the xlate. This reset causes the end node to immediately release the connection, avoiding the TIME\_WAIT state. Multi-session PAT, on the other hand, uses the PAT timeout, by default 30 seconds. For "hit-and-run" traffic, such as HTTP or HTTPS, the per-session feature can dramatically increase the connection rate supported by one address. Without the per-session feature, the maximum connection rate for one address for an IP protocol is approximately 2000 per second. With the per-session feature, the connection rate for one address for an IP protocol is 65535/average-lifetime.

By default, all TCP traffic and UDP DNS traffic use a per-session PAT xlate. For traffic that can benefit from multi-session PAT, such as H.323, SIP, or Skinny, you can disable per-session PAT by creating a per-session deny rule.

### Some Features of the Per-Session NAT Rules Table

This Translation Rules table is a standard Security Manager rules table, as described in [Using Rules Tables, page 12-7](#). For example, you can move, show and hide columns; you can re-order the rules; and you can right-click certain table cells to edit that parameter.

The NAT rules listed in this table are processed on a first-match basis; therefore, order is important.

### Related Topics

- [Add and Edit Per Session NAT Rule Dialog Boxes, page 23-46](#)
- [NAT Policies on Security Devices, page 23-15](#)
- [About "Simplified" NAT on ASA 8.3+ Devices, page 23-3](#)
- Standard rules table topics:
  - [Using Rules Tables, page 12-7](#)
  - [Filtering Tables, page 1-45](#)
  - [Table Columns and Column Heading Features, page 1-46](#)

### Navigation Path

- (Device view) Select **NAT > Per-Session NAT Rules** from the Device Policy selector.

- (Policy view) Select **NAT (PIX/ASA/FWSM) > Per-Session NAT Rules** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or right-click **Translation Rules** to create a new policy.

The Per-Session NAT Rules page is displayed.

### Adding, Editing and Deleting Rules

To **add** a per-session NAT rule:

1. Select the rule under which the rule is to be added. If you do not select a heading, the rule will be added to the end of the table by default.
2. Open the Add Per-Session NAT Rule dialog box: either click the **Add Row** button at the bottom of the table, or right-click anywhere in the table and choose **Add Row** from the pop-up menu.
3. Define the rule and then click **OK** to close the dialog box, adding the rule to the table.

See [Add and Edit Per Session NAT Rule Dialog Boxes, page 23-46](#) for a complete description of the Add Per-Session NAT Rule dialog box.

To **edit** a per-session NAT rule:

1. Open the Edit Per-Session NAT Rule dialog box for the desired rule: either select the rule in the Per-Session NAT rules table and then click the **Edit Row** button at the bottom of the table, or simply right-click the desired rule entry and choose **Edit Row** from the pop-up menu.
2. Edit the rule and then click **OK** to close the dialog box.

See [Add and Edit Per Session NAT Rule Dialog Boxes, page 23-46](#) for a complete description of the Edit Per-Session NAT Rule dialog box.

To **delete** a per-session NAT rule, select the rule in the table and click the **Delete Row** button at the bottom of the table, or simply right-click the desired rule entry and choose **Delete Row** from the pop-up menu.

### Enabling and Disabling Rules

You can disable one or more consecutive rules without removing them from the table, as follows:

1. Select the rule(s) to be disabled. If selecting a contiguous block of rules, click the first and then Shift-click the last rule of the block.
2. Right-click a selected rule, and choose **Disable** from the pop-up menu.

Disabled rules are grayed-out in the table.

To re-enable one or one or more consecutive disabled rules, repeat this process, choosing **Enable** from the pop-up menu.

## Add and Edit Per Session NAT Rule Dialog Boxes

By default, all TCP PAT traffic and all UDP DNS traffic uses per-session PAT. To use multi-session PAT for traffic, you can configure per-session PAT rules: a permit rule uses per-session PAT, and a deny rule uses multi-session PAT.

For more information about per-session vs. multi-session PAT, see [Per-Session NAT Rules: ASA 9.0\(1\)+](#).

### Defaults

By default, the following rules are installed:

- Permit TCP from any (IPv4 and IPv6) to any (IPv4 and IPv6)

- Permit UDP from any (IPv4 and IPv6) to domain

These rules do not appear in the rule table.

#### Note

You cannot remove these rules, and they always exist after any manually-created rules. Because rules are evaluated in order, you can override the default rules. For example, to completely negate these rules, you could add the following:

```
Deny TCP from any (IPv4 and IPv6) to any (IPv4 and IPv6)
Deny UDP from any (IPv4 and IPv6) to domain
```

#### Navigation Path

From the [Per-Session NAT Rules: ASA 9.0\(1\)+](#) page, do one of the following:

- To add a rule, select the rule under which you want the rule added, and then click the **Add Row** button below the rules table, or right-click anywhere inside the table and choose **Add Row** to open the Add Per-Session NAT Rule dialog box.
- To edit a rule, select the rule and click the **Edit Row** button, or simply right-click the rule and choose **Edit Row** to open the Edit Per-Session NAT Rule dialog box for that rule.

## **PART 3**

### **VPN Configuration**

# CHAPTER 24

## Managing Site-to-Site VPNs: The Basics

---

A virtual private network (VPN) consists of multiple remote peers transmitting private data securely to one another over an unsecured network, such as the Internet. Site-to-site VPNs use tunnels to encapsulate data packets within normal IP packets for forwarding over IP-based networks, using encryption to ensure privacy and authentication to ensure integrity of data.

In Cisco Security Manager, site-to-site VPNs are implemented based on IPsec policies that are assigned to VPN topologies. An IPsec policy is a set of parameters that define the characteristics of the site-to-site VPN, such as the security protocols and algorithms that will be used to secure traffic in an IPsec tunnel. Security Manager translates IPsec policies into CLI commands that can be deployed to the devices in the VPN topology. Several policy types might be required to define a full configuration image that can be assigned to a VPN topology, depending on the IPsec technology type.

The Site-to-Site VPN Manager defines and configures site-to-site VPN topologies and policies on Cisco IOS security routers, PIX Firewalls, Catalyst VPN Service Modules, and Adaptive Security Appliance (ASA) firewall devices.

**Tip**

---

In ASA documentation, site-to-site VPNs are called LAN-to-LAN VPNs. These phrases are equivalent, and we use “site-to-site VPN” in this documentation.

---

You can access the Site-to-Site VPN Manager by selecting **Manage > Site-To-Site VPNs** or clicking the Site-To-Site VPN Manager button on the toolbar.

You can also configure shared policies in Policy view and view and configure topologies in Device view. In Policy View, you can assign IPsec policies to VPN topologies.

This chapter contains the following topics:

# Understanding VPN Topologies

A VPN topology specifies the peers and the networks that are part of the VPN and how they connect to one another. After you create a VPN topology, the policies that can be applied to your VPN topology become available for configuration, depending on the assigned IPsec technology.

Security Manager supports three main types of topologies—hub and spoke, point to point, and full mesh, with which you can create a site-to-site VPN. Not all policies can be applied to all VPN topologies. The policies that can be applied depend on the IPsec technology that is assigned to the VPN topology. In addition, the IPsec technology that is assigned to a VPN depends on the topology type. For example, the DMVPN and Easy VPN technologies can only be applied in a hub-and-spoke topology.

For more information, see [Understanding IPsec Technologies and Policies, page 24-5](#).

The following topics describe:

- [Hub-and-Spoke VPN Topologies, page 24-2](#)
- [Point-to-Point VPN Topologies, page 24-3](#)
- [Full Mesh VPN Topologies, page 24-4](#)
- [Implicitly Supported Topologies, page 24-5](#)

## Hub-and-Spoke VPN Topologies

In a hub-and-spoke VPN topology, multiple remote devices (spokes) communicate securely with a central device (hub). A separate, secured tunnel extends between the hub and each individual spoke.

The following illustration shows a typical hub-and-spoke VPN topology.

**Figure 24-1** *Hub-and-Spoke VPN Topology*

This topology usually represents an intranet VPN that connects an enterprise's main office with branch offices using persistent connections to a third-party network or the Internet. VPNs in a hub-and-spoke topology provide all employees with full access to the enterprise network, regardless of the size, number, or location of its remote operations.

A hub is generally located at an enterprise's main office. Spoke devices are generally located at an enterprise's branch offices. In a hub-and-spoke topology, most traffic is initiated by hosts at the spoke site, but some traffic might be initiated from the central site to the spokes.

If the hub in a hub-and-spoke configuration becomes unavailable for any reason, IPsec failover transfers tunnel connections seamlessly to a failover (backup) hub, which is used by all spokes. You can configure multiple failover hubs for a single primary hub.

In a hub-and-spoke VPN topology, all IPsec technology types can be assigned except GET VPN.

- [Implicitly Supported Topologies, page 24-5](#)
- [Creating or Editing VPN Topologies, page 24-28](#)
- [Chapter 25, “Configuring IKE and IPsec Policies”](#)

## Point-to-Point VPN Topologies

In a point-to-point VPN topology, two devices communicate directly with each other, without the option of IPsec failover as in a hub-and-spoke configuration. To establish a point-to-point VPN topology, you specify two endpoints as peer devices. Because either of the two devices can initiate the connection, the assigned IPsec technology type can be only regular IPsec or IPsec/GRE.

In Security Manager, you can configure a special type of regular IPsec point-to-point VPN called an Extranet. An Extranet VPN is a connection between a device in your managed network and an unmanaged device, such as a router in your service provider's network, a non-Cisco device, or simply a device in your network that is being managed by a different group (that is, one that does not appear in the Security Manager inventory).

The following illustration shows a typical point-to-point VPN topology.

**Figure 24-2** Point-to-Point VPN Topology

- [Creating or Editing Extranet VPNs, page 24-63](#)
- [Chapter 25, “Configuring IKE and IPsec Policies”](#)

## Full Mesh VPN Topologies

A full mesh topology works well in a complicated network where all peers need to communicate with each other. In this topology type, every device in the network communicates with every other device through a unique IPsec tunnel. All devices have direct peer relationships with one another, preventing a bottleneck at the VPN gateway device, and saving the overhead of encryption and decryption on the device.

You can assign only Regular IPsec, IPsec/GRE, and GET VPN technologies to a full mesh VPN topology.

The following illustration shows a typical full mesh VPN topology.

**Figure 24-3** Full Mesh VPN Topology

A full mesh network is reliable and offers redundancy. When the assigned technology is GRE and one device (or node) can no longer operate, all the rest can still communicate with one another, directly or through one or more intermediate nodes. With regular IPsec, if one device can no longer operate, a crypto access control list (ACL) that specifies the protected networks, is created per two peers.

GET VPN is based on the group trust model. In this model, group members register with a key server. The key server uses the Group Domain of Interpretation (GDOI) protocol for distributing the security policy and keys for encrypting traffic between the group members. Because you can configure a primary key server and secondary key servers that synchronize their policies with the primary one, if the primary key server becomes unavailable, a secondary key server can take over.

**Note**

When the number of nodes in a full mesh topology increases, scalability may become an issue—the limiting factor being the number of tunnels that the devices can support at a reasonable CPU utilization.

**Related Topics**

- [Understanding IPsec Technologies and Policies, page 24-5](#)
- [Implicitly Supported Topologies, page 24-5](#)
- [Creating or Editing VPN Topologies, page 24-28](#)
- [Chapter 25, “Configuring IKE and IPsec Policies”](#)

## Implicitly Supported Topologies

In addition to the three main VPN topologies, other more complex topologies can be created as combinations of these topologies. They include:

- **Partial mesh**—A network in which some devices are organized in a full mesh topology, and other devices form either a hub-and-spoke or a point-to-point connection to some of the fully meshed devices. A partial mesh does not provide the level of redundancy of a full mesh topology, but it is less expensive to implement. Partial mesh topologies are generally used in peripheral networks that connect to a fully meshed backbone.
- **Tiered hub-and-spoke**—A network of hub-and-spoke topologies in which a device can behave as a hub in one or more topologies and a spoke in other topologies. Traffic is permitted from spoke groups to their most immediate hub.
- **Joined hub-and-spoke**—A combination of two topologies (hub-and-spoke, point-to-point, or full mesh) that connect to form a point-to-point tunnel. For example, a joined hub-and-spoke topology could comprise two hub-and-spoke topologies, with the hubs acting as peer devices in a point-to-point topology.

## Understanding IPsec Technologies and Policies

Security Manager provides seven types of IPsec technologies that you can configure on the devices in your site-to-site VPN topology—Regular IPsec, IPsec/GRE, GRE Dynamic IP, standard and large scale DMVPN, Easy VPN, and GET VPN. The assigned technology determines which policies you can configure for the VPN.

You assign an IPsec technology to a VPN topology during its creation. After an IPsec technology is assigned to a VPN topology, you cannot change the technology, other than by deleting the VPN topology and creating a new one. See [Defining the Name and IPsec Technology of a VPN Topology, page 24-30](#).

The following topics explain some basic concepts about IPsec technologies and site-to-site VPN policies:

- [Understanding Mandatory and Optional Policies for Site-to-Site VPNs, page 24-6](#)
- [Overview of Site-to-Site VPN Policies, page 24-8](#)
- [Understanding Devices Supported by Each IPsec Technology, page 24-9](#)

- [Including Unmanaged or Non-Cisco Devices in a VPN, page 24-11](#)
- [Understanding and Configuring VPN Default Policies, page 24-12](#)
- [Using Device Overrides to Customize VPN Policies, page 24-13](#)
- [Understanding VRF-Aware IPsec, page 24-14](#)

## Understanding Mandatory and Optional Policies for Site-to-Site VPNs

Some site-to-site VPN policies are mandatory, which means that you must configure them to create a VPN topology or to save your changes when editing them. Most mandatory policies have predefined defaults, which you can use to complete the definition of a VPN topology, but you typically must edit the policies to ensure their settings work for your network.

Optional policies, which you need to configure only if you desire the services defined by the policy, do not come with predefined defaults.

**Tip**

You can configure your own mandatory policy defaults by creating shared policies that specify the desired settings, and then by selecting these shared policies when creating a VPN. You can even make the shared policies the defaults for the Create VPN wizard. However, these default policies do not apply when you create Extranet VPNs; with Extranet VPNs, you must always configure the settings for mandatory policies as part of the normal wizard flow. In addition, you cannot create a default policy for IKEv2 Authentication. For more information, see [Understanding and Configuring VPN Default Policies, page 24-12](#).

Some mandatory policies are mandatory only under certain conditions. For example, an IKEv1 preshared key policy is mandatory only if the default (mandatory) IKEv1 proposal uses preshared key authentication. If the selected IKE authentication method is Certificate (RSA Signature), an IKEv1 Public Key Infrastructure policy is mandatory (see [Deciding Which Authentication Method to Use, page 25-8](#)). If you allow IKEv2 negotiations in the topology, an IKEv2 Authentication policy is mandatory.

The following table lists the mandatory and optional policies for each predefined technology that you can assign to the devices in your site-to-site VPN topology.

**Table 24-1 Site-to-Site VPN IPsec Technologies and Policies**

| Technology                                                                                             | Mandatory Policies                                                                                                                                                                                                                             | Optional Policies                                                       |

## Overview of Site-to-Site VPN Policies

You can access site-to-site VPN policies by selecting **Manage > Site-To-Site VPNs**, or by clicking the **Site-To-Site VPN Manager** button on the toolbar, and then selecting the required policy in the Policies selector of the Site-to-Site VPN window. You can also access site-to-site VPN policies from Device view or Policy view. For more information, see [Accessing Site-to-Site VPN Topologies and Policies, page 24-17](#).

The following is a summary of all of the site-to-site VPN policies, some of which you cannot create as shared policies. Note that some of these policies are documented in the sections that explain remote access VPNs, because the policies are used for both remote access and site-to-site VPNs. However, you must configure these policies separately for each type of VPN.

## Understanding Devices Supported by Each IPsec Technology

Each IPsec technology supports different devices as members of their topology. The following table describes the basic device support. These requirements are enforced when you select devices for a VPN; in some cases, the device lists are filtered to show only supported devices. In other cases, a device might be supported in one role (for example, as a spoke), but not supported in another role; in these cases, you can select the wrong device type, but you are prevented from saving the change (a message will explain the specific problem).

**Tip**

Some device models have NO-VPN versions, which do not support VPN configuration. Thus, although the 3845 model might be supported for a type of VPN, the 3845 NOVPN model is not supported. In addition, the Cisco Catalyst 6500 series ASA Services Module (running software release 8.5(x)) does not support any type of VPN.

**Table 24-2** *Devices Supported by Each IPsec Technology*

| Technology                                                                                                           | Supported Platforms                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Regular IPsec<br>See <a href="#">Chapter 25, “Configuring IKE and IPsec Policies”</a> .                              | Regular IPsec policies can be configured on Cisco IOS security routers (including Aggregation Service Routers, or ASRs), PIX Firewalls, and ASA 5500 series devices. Except for Extranet VPNs, Catalyst VPN service modules are also supported.<br><br>IKEv2 is supported on ASA release 8.4(x) only. If you limit the topology to IKEv2 only, all devices must support IKEv2. If you allow both IKEv1 and IKEv2, devices that do not support IKEv2 automatically use IKEv1. |
| IPsec/GRE (Generic Routing Encapsulation).<br>See <a href="#">Understanding GRE</a> , page 26-2.                     | GRE policies can be configured on Cisco IOS security routers (including ASRs) and Catalyst 6500/7600 devices.                                                                                                                                                                                                                                                                                                                                                                |
| GRE Dynamic IP.<br>See <a href="#">Understanding GRE Configuration for Dynamically Addressed Spokes</a> , page 26-5. | GRE Dynamic IP can be configured on Cisco IOS security routers (including ASRs) and Catalyst 6500/7600 devices.                                                                                                                                                                                                                                                                                                                                                              |

**Table 24-2** *Devices Supported by Each IPsec Technology (Continued)*

| Technology                                                                                                                                                                                      | Supported Platforms                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Including Unmanaged or Non-Cisco Devices in a VPN

Your VPN might include devices that you cannot, or should not, manage in Security Manager. These include:

- Cisco devices that Security Manager supports, but for which your organization is not responsible. For example, you might have a VPN that includes spokes in networks managed by other organizations within your company, or a connection to a service provider or partner network.
- Non-Cisco devices. You cannot use Security Manager to create and deploy configurations to non-Cisco devices.

You have two options for handling these kinds of devices:

- If the connection is a regular IPsec point-to-point connection, you can configure the connection as an Extranet VPN as described in [Creating or Editing Extranet VPNs, page 24-63](#).
- For other types of connections, you can include these devices in the Security Manager inventory as “unmanaged” devices. These devices can serve as endpoints in a VPN topology, but Security Manager does not discover any configurations from the device, nor does it deploy configurations to them.

When the Extranet VPN option will not work, you must do the following before you can add an unmanaged device to a VPN topology:

- Manually add the device as an unmanaged device to the device inventory using the procedure described in [Adding Devices by Manual Definition, page 3-25](#). Ensure that you make the following selections:
  - Select a Cisco device type that is comparable to the device you are adding in terms of VPN-supported technologies. The device type controls the types of VPN topologies to which you can add the device. For example, for GRE/DMVPN, you might select an integrated services router such as an 1800 or 2800 series, whereas in Easy VPN you could also select an ASA or PIX device if appropriate.
  - Deselect the **Manage in Cisco Security Manager** option. This is very important, because the default is to make all new devices managed devices. If you forget to do this while adding the device, you can deselect the option later on the General tab in the device properties (right-click the device and select **Device Properties**).
- Using the interface policy for the device, define the external VPN interface to which managed devices will point. Because the device is unmanaged, your definitions in this policy are never configured on the device; the policy simply represents what you have configured on the device outside of Security Manager.

## Understanding and Configuring VPN Default Policies

For most VPN policies that are mandatory, Security Manager includes “factory default” settings for the policies. These defaults are generic, and might not be appropriate for your network, but they do allow you to complete the creation of a VPN without having to stop and start over when you do not have the needed shared policy configured. Therefore, you can, and should, create your own default VPN policies for mandatory policies. You can also create defaults for certain optional policies.

Before configuring new defaults, consider the types of VPNs you are likely to configure, then review the types of policies for which you can create defaults. Select **Tools > Security Manager Administration**, then select **VPN Policy Defaults** from the table of contents. Select the tabs for the desired IPsec technologies to see which policies are available. If a policy is assigned Factory Default, or if this option is available from the drop-down list, the policy is mandatory; other policies are optional. You can also create default policies for remote access VPNs, and for site-to-site endpoint configurations. Click the **View Content** button next to a selected policy to see the policy definition.

The following procedure explains how to create and use VPN policy defaults.

### Tips

- When you configure VPN default policies, you are selecting shared policies. Although you can configure only one default per policy per IPsec technology, users can select different shared policies when configuring VPNs. Thus, you might want to configure more than one shared policy that users can select, and configure the most commonly-used policy as the default policy. For more information about how users can select different policies when configuring a VPN, see [Assigning Initial Policies \(Defaults\) to a New VPN Topology, page 24-58](#).
- Although the IKEv2 Authentication policy is a mandatory policy for topologies that allow IKEv2 negotiations, there are no IKEv2 Authentication factory default settings, and you cannot create IKEv2 Authentication shared policies. Therefore, whenever you allow IKEv2 in a topology, you must manually configure the IKEv2 Authentication policy before the topology is valid.
- The Public Key Infrastructure policy is required for IKEv1 if you configure the IKE Proposal policy to use certificate authentication. However, there are no factory default settings for this policy, so if you intend to use certificate authentication for IKEv1, consider creating default Public Key Infrastructure policies.
- Keep in mind that any change to a shared policy affects all VPNs that are using the policy. This can make it easy to implement cross-the-board changes that are required for every VPN. However, after creating the VPN, the user can switch from a shared policy to a local policy, so that any changes to the configuration must be done specifically for the VPN topology. For more information about shared policies, see [Managing Shared Policies in Policy View, page 5-47](#).
- These default policies do not apply when you create Extranet VPNs. With Extranet VPNs, you must always configure the settings for mandatory policies as part of the normal wizard flow.

- 
- Step 1** Create the default policies. All default policies are shared policies.
- In Policy view (select **View > Policy View**), select the policy for which you want to configure defaults. The policies are in the **Site-to-Site VPN** or **Remote Access VPN** folders.
  - Click the **Create a Policy (+)** button at the bottom of the shared policy selector, enter a name for the policy, and click **OK**.
  - Configure the desired settings. Click the **Help (?)** button in the toolbar to get reference information about the settings available in the selected policy.
  - Repeat the process until you have created at least one shared policy for each policy for which you want to define a default policy.

- Step 2** If desired, create defaults for the VPN endpoints. These defaults are interface role objects, which identify the interface names used for VPN connections (for example, GigabitEthernet0/1). Create separate roles for internal and external VPN interfaces.
- Select **Manage > Policy Objects** to open the [Policy Object Manager, page 6-4](#).
  - Select **Interface Roles** from the table of contents.
  - Click the **New Object (+)** button, enter the interface name patterns that identify the most commonly used interfaces for VPN internal or external interfaces in your network, and click **OK**.  
For more information about interface roles and the wildcards you can use to configure them, see [Understanding Interface Role Objects, page 6-67](#) and [Creating Interface Role Objects, page 6-68](#).
- Step 3** Submit the policies and policy objects to the database. You will have to resolve any validation errors.
- In non-Workflow mode, select **File > Submit**.
  - In Workflow mode without an activity approver, select **Activities > Approve Activity**.
  - In Workflow mode with an activity approver, select **Activities > Submit Activity**. You will have to wait for the activity to be approved before you can select the policies and objects as defaults.
- Step 4** Select your newly-configured policies and policy objects as VPN policy defaults.
- Select **Tools > Security Manager Administration**, and then select **VPN Policy Defaults** from the table of contents (see [VPN Policy Defaults Page, page 11-53](#)).
  - Select the desired tabs, then select the policies you configured from the drop-down lists for each of the mandatory or optional policies for which you configured defaults.  
On the S2S Endpoints tab, select the appropriate interface role objects.
  - Click **Save** to save your defaults.  
The next time a user runs the Create VPN wizard, the defaults you selected will be used as the wizard's defaults. Users can select any other shared policy or interface role to override the default.
- 

## Using Device Overrides to Customize VPN Policies

Many VPN policies use Security Manager policy objects in their configuration. Policy objects are containers that allow you to create reusable configurations.

Because a VPN policy applies to every device in a VPN topology, you might need to make modifications to a policy object used in a policy for certain devices within the VPN topology. There might even be situations where you need to make modifications for all devices within a topology. You accomplish these modifications with device-level overrides on the policy objects.

For example, when defining a PKI policy, you need to select a PKI enrollment object. If the hub of your VPN uses a different CA server than the spokes, you must use device-level overrides to specify the CA server used by the hub. Although the PKI policy references a single PKI enrollment object, the actual CA server represented by this object differs for the hub, based on the device-level override you define.

To enable a policy object to be overridden, you must select the **Allow Override per Device** option in the policy object definition. You can then create device-level overrides. For more information about overriding a VPN policy object at the device level, see the following topics:

- [Understanding Policy Object Overrides for Individual Devices, page 6-17](#)
- [Allowing a Policy Object to Be Overridden, page 6-18](#)
- [Creating or Editing Object Overrides for a Single Device, page 6-18](#)

- [Creating or Editing Object Overrides for Multiple Devices At A Time](#), page 6-19

## Understanding VRF-Aware IPsec

One obstacle to successfully deploying peer-to-peer VPNs is the separation of routing tables, and the use of overlapping addresses, which usually results from using private IP addresses in customer networks. The VRF-Aware IPsec feature, which introduces IPsec tunnel mapping to Multiprotocol Label Switching (MPLS) VPNs, solves this problem.

The VRF-Aware IPsec feature enables you to map IPsec tunnels to Virtual Routing Forwarding (VRF) instances, using a single public-facing address. A VRF instance defines the VPN membership of a customer site attached to the Provider Edge (PE) router. A VRF comprises an IP routing table, a derived Cisco Express Forwarding (CEF) table, a set of interfaces that use the forwarding table, and a set of rules and routing protocol parameters that control the information that is included in the routing table. A set of routing and CEF tables is maintained for each VPN customer across the MPLS/VPN network.

Since each VPN has its own routing and forwarding table in the router, any customer or site that belongs to a VPN is provided access only to the set of routes contained within that table. Any PE router maintains a number of routing tables and a global routing table per VPN, which can be used to reach other routers in the provider network. Effectively, a number of virtual routers are created in a single physical router. Across the MPLS core to the other PE routers, this routing separation is maintained by adding unique VPN identifiers, such as the route distinguisher (RD).

### Note

VRF-Aware IPsec can also be configured on devices in a remote access VPN. For more information, see [Configuring Dynamic VTI/VRF Aware IPsec in Remote Access VPNs \(IOS Devices\)](#), page 32-7.

In Security Manager, you can configure VRF-Aware IPsec in your hub-and spoke VPN topology, with either a single device providing all functionality (“one-box” solution) or with multiple devices, each providing a part of the functionality (“two-box” solution). The solution of one device providing all the functionality can affect performance by overloading the system, whereas separating the functionality in a two-box solution provides better scaling for each function.

The following topics describe:

- [VRF-Aware IPsec One-Box Solution](#), page 24-14
- [VRF-Aware IPsec Two-Box Solution](#), page 24-15
- [Enabling and Disabling VRF on Catalyst Switches and 7600 Devices](#), page 24-17

For information on configuring VRF-aware IPsec, see [Configuring VRF Aware IPsec Settings](#), page 24-46.

## VRF-Aware IPsec One-Box Solution

In the one-box solution, IPsec tunnels terminate on a Cisco IOS router, which serves as the Provider Edge (PE) device. The PE device maps these tunnels to the appropriate MPLS/VPN network and serves as the IPsec Aggregator, by performing IPsec encryption and decryption from the Customer Edge (CE) devices.

### Note

The configuration of routing between the PE device and the MPLS cloud is done by Cisco IP Solution Center. See the [Cisco IP Solution Center MPLS VPN User Guide](#).

The following illustration shows the topology of a one-box solution.

**Figure 24-4 VRF-Aware IPsec One-Box Solution**

#### Related Topics

- [Understanding VRF-Aware IPsec, page 24-14](#)
- [Configuring VRF Aware IPsec Settings, page 24-46](#)
- [Defining the Endpoints and Protected Networks, page 24-33](#)

## VRF-Aware IPsec Two-Box Solution

In the two-box solution, the PE device does just the MPLS mapping, while a separate IPsec Aggregator device does the IPsec encryption and decryption from the CEs.

#### Note

Security Manager fully manages the IPsec Aggregator, including routing to the PE device. The PE device is fully managed by Cisco IP Solution Center. This includes routing between the PE device and the MPLS cloud, and routing from the PE to the IPsec Aggregator. For more information, see the [Cisco IP Solution Center MPLS VPN User Guide](#).

The following illustration shows the topology of a two-box solution.

Figure 24-5 VRF-Aware IPsec Two-Box Solution

Using the two-box solution, you configure VRF-Aware IPsec on devices in your VPN topology, as follows:

1. Configure the connection between the IPsec Aggregator and the PE device.

Create a hub-and-spoke VPN topology and assign an IPsec technology to it. In this topology, the hub is the IPsec Aggregator, and the spokes may be Cisco IOS routers, PIX Firewalls, Catalyst VPN service modules, or Adaptive Security Appliance (ASA) devices. The IPsec Aggregator may be a security router or a Catalyst VPN service module. You then define the VRF parameters (VRF name and unique routing identifier) on the hub.

**Note** VRF-Aware IPsec supports the configuration of IPsec, GRE, or Easy VPN technologies on Cisco IOS routers and Catalyst VPN service modules. DMVPN is also supported, but only on Cisco IOS routers.

2. Specify the VRF forwarding interface (or VLAN for a Catalyst VPN service module) between the IPsec Aggregator and the PE device.
3. Define the routing protocol and autonomous system (AS) number to be used between the IPsec Aggregator and the PE. Available routing protocols include BGP, EIGRP, OSPF, RIPv2, and Static Route.

If the routing protocol defined between the IPsec Aggregator and the PE differs from the routing protocol used for the secured IGP, routing is redistributed to the secured IGP, using this routing protocol and AS number. Routing is also redistributed from the secured IGP to the PE.

**Note** Redistributing the routing is only relevant when IPsec/GRE or DMVPN is the selected technology.

## Enabling and Disabling VRF on Catalyst Switches and 7600 Devices

Deployment fails when you change the virtual routing and forwarding (VRF) mode on the Catalyst switches and 7600 hub of an existing site-to-site VPN. For example, if you initially configured VRF in the Create VPN wizard and deployed, but later return to the Peers policy and deselect the Enable VRF Settings check box, deployment fails. (This setting is found in the VRF Aware IPsec tab of the Edit Endpoints dialog box; see [Configuring VRF Aware IPsec Settings, page 24-46](#).) Deployment likewise fails if you try to enable VRF on a VPN that was not initially configured with it.

You cannot change the VRF mode on a Catalyst 6500/7600 during VPN operation. This restriction applies only to Catalyst 6500/7600 hubs, not to any other device type.

This restriction does not apply to changes made to the VRF settings themselves. For example, if VRF is configured on the VPN topology, you can return to the Peers policy and change the VRF name or route distinguisher.

If you need to change the VRF mode of a VPN, and you are using Catalyst 6500/7600 devices as hubs, use the following procedure.

### Related topics

- [Understanding VRF-Aware IPsec, page 24-14](#)
- [VRF-Aware IPsec One-Box Solution, page 24-14](#)
- [VRF-Aware IPsec Two-Box Solution, page 24-15](#)

- 
- Step 1** Delete the VPN topology from Security Manager.
- Step 2** Deploy your changes.
- Step 3** Reload (restart) the Catalyst 6500/7600 device.
- Step 4** Right-click the device in Security Manager and select **Discover Policies on Device**. Perform a complete policy rediscovery.
- Step 5** Open the Create VPN wizard and redefine the VPN topology. At this point, you can select a different VRF mode. See [Configuring VRF Aware IPsec Settings, page 24-46](#) and [Creating or Editing VPN Topologies, page 24-28](#).
- 

## Accessing Site-to-Site VPN Topologies and Policies

You can use the following methods to access and configure site-to-site VPN topologies and policies:

- **Site-to-Site VPN Manager**—This is the main tool for configuring VPN topologies. You can view a list of all site-to-site VPNs configured in Security Manager and edit their configurations and policies, including device membership. For information on using this tool, see [Site-to-Site VPN Manager Window, page 24-18](#).
- **Site-to-Site VPN policy in Device view**—When you select a device in device view, you can select the Site-to-Site VPN policy in the Policies selector to see a list of all site-to-site VPNs in which the device participates and edit those topologies. You can also create new VPNs, or select a VPN and

open the Site-to-Site VPN Manager to edit the policies for the selected VPN. This device view policy is essentially a short-cut into the Site-to-Site VPN Manager. For more information about using this policy, see [Configuring VPN Topologies in Device View, page 24-19](#).

- **Site-to-Site VPN folder in Policy view**—Policy view is used to create shared policies. Many of the site-to-site VPN policies are shareable. Thus, you can configure shared policies that you can assign to more than one VPN topology while configuring the topology in the Site-to-Site VPN Manager. You can configure shared policies as defaults for the Create VPN wizard, as described in [Understanding and Configuring VPN Default Policies, page 24-12](#).

You can also create shared policies from the Site-to-Site VPN Manager window in much the same way you can create them from local policies in Device view, although all sharing commands in the Site-to-Site VPN Manager window are available only on the right-click context menu (when right-clicking a shareable policy).

For more information on creating shared policies in Policy view, see [Managing Shared Policies in Policy View, page 5-47](#).

## Site-to-Site VPN Manager Window

The Site-to-Site VPN Manager lists all site-to-site VPNs configured in Security Manager. The VPNs selector, in the upper left pane of the window, lists all existing VPN topologies (see [Understanding VPN Topologies, page 24-2](#)). An icon indicates the type of VPN (hub and spoke, point to point, or full mesh). To view or edit a topology, select it, and its policies are loaded into the policy selector in the lower left pane. Select a policy to see its definition in the right pane.

To open the Site-to-Site VPN Manager, click the **Site-To-Site VPN Manager** button on the toolbar or select **Manage > Site-To-Site VPNs**.

Use the Site-to-Site VPN Manager window to:

- Create, edit, and delete VPN topologies.
  - To create a VPN topology, click the **Create VPN Topology (+)** button above the VPN selector and select the type of topology you want to create from the options that are displayed. This action opens the Create VPN Wizard or the Create Extranet VPN wizard. For more information, see [Creating or Editing VPN Topologies, page 24-28](#) or [Creating or Editing Extranet VPNs, page 24-63](#).
  - To edit a VPN topology, select it and click the **Edit VPN Topology (pencil)** button, or right-click it and select **Edit**. This opens the Edit VPN or Edit Extranet VPN dialog box, which contains the most of the same pages as the Create VPN wizard in a tabbed layout.
  - To delete a VPN topology, select it and click the **Delete VPN Topology (trash can)** icon, or right-click it and select **Delete**. You are asked to confirm the deletion. See [Deleting a VPN Topology, page 24-67](#).
- View detailed information about each VPN topology; select the topology, then select the VPN Summary policy. See [Viewing a Summary of a VPN Topology's Configuration, page 24-59](#).
- View and configure the endpoints defined for a VPN topology. You can see endpoints on the Endpoints tab or when editing a VPN topology, or by selecting the **Peers** policy. For GET VPN topologies, there is no Peers policy; instead, use the **Key Servers** and **Group Members** policies to view and configure endpoints. For Extranet VPNs, the endpoints are on the Device Selection tab when editing the VPN, or also in the Peers policy.
- View and edit the policies assigned to a VPN topology, assign shared policies, or create shared policies from existing policies. For information on individual policies, see [Overview of Site-to-Site VPN Policies, page 24-8](#).

The options and methods for configuring shared policies from the Site-to-Site VPN Manager are the same as those from Device view, as explained in the sections under [Working with Shared Policies in Device View or the Site-to-Site VPN Manager, page 5-34](#) and [Using the Policy Banner, page 5-35](#). You can share, assign, unassign, edit assignments, and rename policies, but no VPN policies allow inheritance. To perform these tasks, select the VPN topology, then right-click the desired policy and select the desired command.

You can also use Policy view to configure shared VPN policies.

## Configuring VPN Topologies in Device View

Use the Site-to-Site VPN Device view policy to view and edit the site-to-site VPN topologies to which a device belongs, if any. You can edit the VPN policies and change whether the device participates in the topology. You can also create new VPN topologies.

This policy is essentially an access point for the Site-to-Site VPN Manager (see [Site-to-Site VPN Manager Window, page 24-18](#)).

To open this policy, in Device view, select the desired device and then select **Site-to-Site VPN** from the Policy selector.

The VPN topologies table lists all of the site-to-site VPNs to which this device belongs. Information includes the type of VPN, its name, IPsec technology, and description.

- To add a VPN, click the **Create VPN Topology** button, or right-click in the table and select **Create VPN Topology** and select the type of topology you want to create from the options that are displayed. This action opens the Create VPN Wizard or the Create Extranet VPN wizard. For more information, see [Creating or Editing VPN Topologies, page 24-28](#) or [Creating or Editing Extranet VPNs, page 24-63](#).
- To edit a VPN, select it and click the **Edit VPN Topology** button, right-click the VPN and select **Edit VPN Topology**, or simply double-click the entry. This opens the Edit VPN or Edit Extranet VPN dialog box, which is a tabbed version of the Create VPN wizard (see [Creating or Editing VPN Topologies, page 24-28](#) or [Creating or Editing Extranet VPNs, page 24-63](#)).
- To edit the policies for a VPN, select it and click the **Edit VPN Policies** button. The Site-to-Site VPN Window opens displaying information about the VPN topology; select the desired policy from the Policies selector to edit it.
- To delete a VPN, select it and click the **Delete VPN Topology** button, or right-click the VPN and select **Delete VPN Topology**. You are asked to confirm the deletion. For more information, see [Deleting a VPN Topology, page 24-67](#).

## Site-To-Site VPN Discovery

You can discover the VPN topologies that are already deployed in your network so that you can use Security Manager to manage them. Your VPN configurations are brought into Security Manager and displayed as site-to-site VPN policies.

Except for Extranet VPNs, you can also rediscover the configurations of existing VPN topologies that are already managed with Security Manager. For information about Site-to-Site VPN rediscovery, see [Rediscovering Site-to-Site VPNs, page 24-26](#).

**Note**

You can also discover configurations on devices in remote access VPNs that are already deployed in your network. See [Discovering Remote Access VPN Policies](#), page 29-12.

These topics provide information about Site-to-Site VPN discovery:

- [Supported and Unsupported Technologies and Topologies for VPN Discovery](#), page 24-20
- [Prerequisites for VPN Discovery](#), page 24-21
- [VPN Discovery Rules](#), page 24-21
- [Discovering Site-to-Site VPNs](#), page 24-24
- [Defining or Repairing Discovered VPNs with Multiple Spoke Definitions](#), page 24-25
- [Rediscovering Site-to-Site VPNs](#), page 24-26

## Supported and Unsupported Technologies and Topologies for VPN Discovery

This topic lists the technologies and topologies that Security Manager can discover, as well as the VPN features that are provisioned by Security Manager but cannot be discovered.

### Supported Technologies for VPN Discovery

- IPsec, including LAN-to-LAN configurations on ASA devices.
- IPsec + GRE
- IPsec + GRE dynamic IP
- DMVPN
- Easy VPN
- GET VPN

### Supported Topologies for VPN Discovery

- Point to point
- Hub and spoke
- Full mesh
- Extranet VPN (point-to-point to an unmanaged device)

### VPN Features Provisioned by Security Manager but Unsupported for VPN Discovery

- Large Scale DMVPN with IPsec Terminator (high-concentration hub)
- VRF-Aware IPsec
- Dial backup
- IPsec and ISAKMP profiles for Easy VPN
- Easy VPN with High Availability

If you define and deploy policies of these types using Security Manager, your policies overwrite the device configurations that were not discovered. Therefore, if you want Security Manager to manage existing configurations, you should define policies that match the existing configurations as closely as possible. (Use **Tools > Preview Configuration** to examine the results before deploying.) The VPN

provisioning mechanism leverages the content of the existing configuration as much as possible (assuming the content matches the policies configured in Security Manager), but does not retain the naming conventions used in the CLI commands.

**Related Topics**

- [VPN Discovery Rules, page 24-21](#)
- [Discovering Site-to-Site VPNs, page 24-24](#)

## Prerequisites for VPN Discovery

For successful VPN discovery, the following prerequisites must be met:

- Except for Extranet VPNs, all devices participating in the VPN must be added to the Security Manager inventory.
- You must provide Security Manager with some basic information about the VPN. The VPN discovery wizard prompts you for the following information:
  - VPN topology (hub and spoke, point to point, full mesh, Extranet).
  - VPN technology (Regular IPsec, IPsec/GRE, GRE dynamic IP, DMVPN, Easy VPN, GET VPN).
  - Devices in the VPN and their roles (hub/spoke). For Extranet VPNs, you specify the managed device only.
  - Source of the VPN configuration. The VPN can be discovered directly from the live network or from Security Manager's Configuration Archive.
- Each device in the VPN must have a crypto map associated with a physical interface. This rule does not apply to the remote (unmanaged) devices in an Extranet VPN.
- If you use OSPF as your routing protocol in a VPN topology, all devices in the VPN must use the same OSPF process number.
- Each PIX 6.3 or ASA 5505 client device in an Easy VPN topology must have a vpnclient configuration.

**Related Topics**

- [Supported and Unsupported Technologies and Topologies for VPN Discovery, page 24-20](#)
- [VPN Discovery Rules, page 24-21](#)
- [Discovering Site-to-Site VPNs, page 24-24](#)

## VPN Discovery Rules

The following table describes the rules by which Security Manager translates and discovers your VPN configurations, and how it handles instances where your configuration on the device does not match what is supported by Security Manager.

**Tip**

Because Extranet VPN discovery involves the analysis of a single device (the managed device), most of these rules do not apply to Extranet VPN discovery. Any rule that involves consistency of values among devices in the VPN is not applicable.

**Table 24-3** VPN Discovery Rules

| If this condition exists:                                                      | The VPN discovery is handled as follows:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Security Manager cannot contact a device in the VPN for live device discovery. | <ul style="list-style-type: none"> <li>• If the device is the only hub or spoke in the VPN, discovery fails.</li> <li>• If there are other hubs or spokes in the VPN, discovery proceeds but the unavailable device is not discovered.</li> <li>• Except for Extranet VPNs, if the device is a peer in a point-to-point topology, discovery fails. For Extranet VPNs, only the managed device is contacted, and discovery fails if it cannot be contacted.</li> <li>• If the device is a peer in a full mesh topology and there are only two devices, including the unavailable one, in the topology, discovery fails. If there are more than two devices, discovery proceeds but the unavailable device is not discovered.</li> </ul> |
| The VPN is a LAN-to-LAN VPN on an ASA.                                         | <p>The ASA documentation uses “LAN-to-LAN” as a synonym for “site-to-site.” In a LAN-to-LAN VPN configuration, the ASA uses tunnel groups, which when used in a remote access VPN configuration, Security Manager discovers as connection profiles.</p> <p>When discovering site-to-site VPNs on an ASA that uses LAN-to-LAN (L2L) tunnel groups, Security Manager creates a site-to-site VPN topology, and the L2L tunnel groups are not presented to you as connection profiles. Instead, you edit the properties of the VPN topology, and during deployment, Security Manager will translate the configuration into the appropriate L2L tunnel group commands.</p>                                                                  |

**Table 24-3** VPN Discovery Rules (Continued)

| <b>If this condition exists:</b>                                                                                   | <b>The VPN discovery is handled as follows:</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| There are inconsistencies in the policies or values in the VPN configurations across the devices in the VPN.       | <ul style="list-style-type: none"> <li>• If the values on the hub and the spokes differ, preference is given to the values on the hub.</li> <li>• If a simple selection of one policy or value from several eligible policies or values is required and does not put functionality at risk, Security Manager selects a single policy/value that is common to all devices. For example, a VPN can have a single IKE policy only, whereas there can be more than one IKE policy on the devices.</li> <li>• If selecting one value puts the functionality at risk, no value is discovered for the policy and a validation message is received upon deployment.</li> <li>• If numeric values differ, a message is generated during discovery, and the lower value is discovered. For example, the lowest SA lifetime value in an IPsec policy.</li> <li>• If none of the above options are possible, VPN discovery fails.</li> </ul> |
| Preshared key configuration—there is a different key per set of peers.                                             | The preshared key policy is not discovered; you will have to configure it after discovery is completed. Security Manager discovers preshared key policies only when the preshared key has the same value on all devices.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| There is more than one eligible crypto map on the device.                                                          | The crypto map that is associated with all or the majority of the devices selected for VPN discovery is used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| A spoke does not have a crypto map associated with the hub.                                                        | VPN discovery proceeds but the spoke is not discovered and an error message is generated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| A device does not have the selected transform set value.                                                           | VPN discovery proceeds but the device might removed from the VPN topology.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| A device does not have the selected IKE proposal.                                                                  | VPN discovery proceeds but the device might removed from the VPN topology.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| A device supports DVTI, but does not have DVTI or a crypto map configured.                                         | VPN discovery fails.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| A server supports DVTI, but does not have an IP address configured in the DVTI configuration.                      | VPN discovery proceeds but with a warning.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| A client does not support DVTI.                                                                                    | If the hub is configured with DVTI, discovery proceeds without any warning or Error.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| A Hub and Spoke topology where the spokes are not using the same VPNSPA/VSPA slot on the hub (Catalyst 6500/7600). | VPN discovery fails.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| The same set of key servers and group members are participating in more than one GET VPN.                          | Security Manager discovers only one of the topologies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Table 24-3** VPN Discovery Rules (Continued)

| If this condition exists:                                                                         | The VPN discovery is handled as follows:                                                                                                                                                                                                                                                                           |

## Discovering Site-to-Site VPNs

This procedure describes how to discover a Site-to-Site VPN that is already working in your network but that has not yet been defined in Security Manager.

**Related Topics**

- [Discovering Site-to-Site VPNs, page 24-24](#)
- [Discovering Policies, page 5-12](#)
- [Supported and Unsupported Technologies and Topologies for VPN Discovery, page 24-20](#)
- [Prerequisites for VPN Discovery, page 24-21](#)
- [VPN Discovery Rules, page 24-21](#)
- [Understanding Devices Supported by Each IPsec Technology, page 24-9](#)
- [Including Unmanaged or Non-Cisco Devices in a VPN, page 24-11](#)

**Step 1** In Device view, select **Policy > Discover VPN Policies** to open the Discover VPN Policies Wizard—Name and Technology page.

**Step 2** Specify the following information:

- **VPN Name**—The name of the VPN being discovered.  
 You cannot specify the name when discovering Extranet VPNs. Instead, Security Manager discovers all Extranets defined on the device, and for each Extranet, the VPN name is a hyphenation of the local and remote IP addresses. For example, if the local address is 10.100.10.1 and the remote address is 10.100.11.1, the Extranet VPN is named **10.100.10.1-10.100.11.1**.
- **Description**—An optional description of the VPN. You cannot add a description to Extranet VPN discovery.
- **Topology**—The type of VPN that you are discovering—Hub and Spoke, Point to Point, Full Mesh, or Extranet.

- **IPsec Technology**—The IPsec technology assigned to the VPN—Regular IPsec, IPsec/GRE, GRE Dynamic IP (sub-technology), DMVPN, Easy VPN, or GET VPN. The topology you select controls what is available in this list.

If you selected IPsec/GRE, you must also specify the type which may be **Standard** (for IPsec/GRE) or **Spokes with Dynamic IP** (to configure GRE Dynamic IP).

- **Discover From**—You can either discover the VPN directly from the network or from Configuration Archive.
  - **Network**—Security Manager connects to all live devices to obtain the device configuration. For Extranet VPN discovery, Security Manager connects to the single managed device that you specify.
  - **Config Archive**—Discovery from Configuration Archive is recommended if you deploy to configuration files instead of live devices. The most recent version of the device configuration in Configuration Archive is used for all devices.

**Step 3** Click **Next** to open the Discover VPN Policies Wizard—Device Selection Page.

**Step 4** Select the devices participating in the VPN and their role in the VPN (hub, spoke, peer one, peer two, local device, key server, group member, or simply selected devices for full-mesh VPNs) depending on the topology type. For Easy VPN topologies, servers are hubs and clients are spokes.

If there are two or more IPsec terminators in a hub-and-spoke VPN, use the Up and Down arrow buttons to ensure the primary hub is listed first. When there is only one IPsec terminator, regardless of how many hubs are connected to the same IPsec terminator, it is not possible to designate one hub as the primary hub.

For more detailed information on selecting devices for a VPN, see [Selecting Devices for Your VPN Topology, page 24-32](#).

**Step 5** Click **Finish** to close the wizard and start the discovery process. The Discovery Status window opens and displays the status of the discovery and indicates whether the discovery of each device has been successful or has failed (see [Viewing Policy Discovery Task Status, page 5-21](#)). Error or warning messages are provided to indicate the source of any problems, which may be VPN specific or device specific.

Except for Extranet discovery, when the discovery process completes successfully, and you close the Discovery Status dialog box, the Site-to-Site VPN Manager window opens, displaying summary information for the VPN that was discovered. For Extranet discovery, you must either manually open the Site-to-Site VPN Manager, or select the Site-to-Site VPN policy in Device view, to see the list of discovered Extranet VPNs.

**Step 6** Verify that the VPN policies are as required. Edit the policies as necessary.

**Tip** When discovering Extranet VPNs, all Extranet VPNs defined on the selected device are discovered. Delete the ones that you do not want to manage in Security Manager.

## Defining or Repairing Discovered VPNs with Multiple Spoke Definitions

If you discover a VPN whose spokes contain different definitions (for example, different client modes for Easy VPN spokes), Security Manager changes the definitions during discovery to create a uniform definition for all spokes. This behavior occurs because VPN topologies in Security Manager can contain only one set of spoke definitions.

If you want to maintain your original definitions, or create a new VPN that has spokes with different definitions, you can choose one of two approaches:

- Define multiple VPN topologies in Security Manager, where each topology includes spokes containing matching spoke definitions.
- Define a FlexConfig policy that contains the specialized definition, then assign the policy to the spokes that require this definition, as described in the following procedure.

#### Related Topics

- [Creating a New Shared Policy, page 5-51](#)
- [Creating FlexConfig Policy Objects, page 7-27](#)
- [Modifying Policy Assignments in Policy View, page 5-51](#)
- [Site-To-Site VPN Discovery, page 24-19](#)
- [Discovering Site-to-Site VPNs, page 24-24](#)
- [VPN Discovery Rules, page 24-21](#)

- 
- Step 1** Create a shared FlexConfig policy in Policy view:
- Select **View > Policy View**.
  - Right-click **FlexConfigs** in the Policy Type selector, then select **New FlexConfigs Policy**.
  - Enter a name for the policy and click **OK**.
- Step 2** Define the FlexConfig policy by creating and selecting a FlexConfig object:
- In the work area of Policy view, click the **Add** button on the Details tab.
  - In the FlexConfigs Selector, click the **Create** button in the lower-left corner of the window to open [Add or Edit FlexConfig Dialog Box, page 7-29](#).
  - Define an appended FlexConfig object that contains the required client definition. For example, to define the client mode on an Easy VPN spoke, enter the following commands:
 

```
crypto ipsec client ezvpn CSM_EASY_VPN_CLIENT_1
mode client
exit
```
  - After you create the FlexConfig object, add it to the FlexConfig policy using the selector.
- Step 3** In the work area of Policy view, use the Assignments tab to select the spokes to which this policy should be assigned, then click **Save**.
- Step 4** Deploy the policy.
- 

## Rediscovering Site-to-Site VPNs

You can rediscover the configurations of existing VPN topologies that are already managed with Security Manager so that you do not have to recreate policies changes in the application.

The same rules by which Security Manager translates and discovers VPN configurations apply also to rediscovery. However, you can perform rediscovery only on devices that participate in a VPN topology, and you cannot make any changes to the IPsec technology or topology type. Only the configurations of

device specific policies, such as VPN interfaces and protected networks, and any High Availability (HA) policies that are configured on hubs, can be rediscovered. VPN global policies, such as IKE proposals or PKI enrollments, cannot be rediscovered. In addition, you cannot rediscover the following topologies:

- Easy VPN topologies with Dynamic VTI
- Extranet VPNs

This procedure describes how to rediscover the configurations of a Site-to-Site VPN topology that already exists in Security Manager.

#### Related Topics

- [Discovering Site-to-Site VPNs, page 24-24](#)
- [Discovering Policies, page 5-12](#)
- [Prerequisites for VPN Discovery, page 24-21](#)
- [VPN Discovery Rules, page 24-21](#)
- [Understanding Devices Supported by Each IPsec Technology, page 24-9](#)
- [Including Unmanaged or Non-Cisco Devices in a VPN, page 24-11](#)

---

**Step 1** In the Site-to-Site VPN Manager window, right-click the VPN topology whose configurations you want to rediscover and select **Rediscover Peers**. This opens the Rediscover VPN Policies Wizard—Name and Technology page.

This page displays the type of topology and IPsec technology used in the VPN, which you cannot change.

**Step 2** Specify the following information:

- **VPN Discovery Name**—The name of the rediscover VPN job.
- **Description**—An optional description of the VPN.
- **Discover From**—You can either rediscover the VPN directly from the network or from Configuration Archive.
  - Network—Security Manager connects to all live devices to obtain the device configuration.
  - Config Archive—Rediscovery from Configuration Archive is recommended if you deploy to configuration files instead of live devices. The most recent version of the device configuration in Configuration Archive is used for all devices.

**Step 3** Click **Next** to open the Rediscover VPN Policies Wizard—Device Selection page.

**Step 4** Select the devices whose peer level policies need to be rediscovered and their role in the VPN (hub, spoke, peer one, peer two, key server, group member, or simply selected devices for full-mesh VPNs) depending on the topology type. For Easy VPN topologies, servers are hubs and clients are spokes.

If there are two or more IPsec terminators in a hub-and-spoke VPN, use the Up and Down arrow buttons to ensure the primary hub is listed first. When there is only one IPsec terminator, regardless of how many hubs are connected to the same IPsec terminator, it is not possible to designate one hub as the primary hub.

For more detailed information on selecting devices for a VPN, see [Selecting Devices for Your VPN Topology, page 24-32](#).

**Step 5** Click **Finish** to close the wizard and start the rediscovery process. The Discovery Status window opens and displays the status of the rediscovery and indicates whether the rediscovery of each device has been successful or has failed (see [Viewing Policy Discovery Task Status, page 5-21](#)). Error or warning messages are provided to indicate the source of any problems, which may be VPN specific or device specific.

When the rediscovery process completes successfully, and you close the Discovery Status dialog box, the Site-to-Site VPN Manager window opens, displaying summary information for the VPN that was rediscovered.

## Creating or Editing VPN Topologies

Security Manager supports three basic types of topologies with which you can create a site-to-site VPN. Use the Create VPN wizard to create a hub-and-spoke, point-to-point, or full mesh VPN topology across multiple device types. For more information about these topologies, see [Understanding VPN Topologies, page 24-2](#).

### Tip

If you want to create an Extranet point-to-point VPN, read [Creating or Editing Extranet VPNs, page 24-63](#) instead of this topic.

Creating a VPN topology involves specifying the devices and the networks that make up the site-to-site VPN. You define the devices and their roles (such as hub, spoke, peer, key server, group member), the VPN interfaces that are the source and destination endpoints of the VPN tunnel, and the protected networks that will be secured by the tunnel. When you create a VPN topology, you assign to it the IPsec technology (such as Regular IPsec, IPsec/GRE, GRE Dynamic IP, DMVPN, Large Scale DMVPN, Easy VPN, GET VPN) with which a predefined set of policies is associated. See [Understanding Mandatory and Optional Policies for Site-to-Site VPNs, page 24-6](#).

### Note

When you complete the Create VPN wizard, your topology might be immediately deployable, because Security Manager provides defaults for mandatory policies. However, if you use Security Manager defaults, be sure to verify that the settings will work properly in your network. For more information, see [Understanding and Configuring VPN Default Policies, page 24-12](#).

When you edit a VPN topology, the Edit VPN dialog box contains the same pages as the Create VPN wizard (except for the VPN defaults page), but the pages are laid out in a tabbed format rather than being presented as a wizard. The only exception is for GET VPN topologies, where you can edit only the name and description of the topology (you must edit GET VPN policies to change topology attributes, see [Configuring GET VPN, page 28-12](#)). Clicking **OK** on any tab in the dialog box saves your definitions on all the tabs. For all topologies, you must edit mandatory and optional policies originally presented on the VPN defaults page directly.

By editing a VPN topology, you can change its device structure (adding or removing devices), change the VPN interfaces and protected networks defined for a device, or modify the policies that are assigned to the VPN. For example, if your organization frequently opens new sites, you might need to add spokes to an existing hub-and-spoke VPN while applying all policies of the VPN to the new spokes. Or, you might want to increase resiliency by adding a secondary hub to a VPN that has only one hub. While editing a VPN topology, you might also need to modify the policies assigned to it, for example, to change an IKE algorithm to a more secured one, or to change the DES encryption algorithm for a VPN to make it more secure.

**Tip**

After you create a topology, you cannot change the technology used in the VPN. Instead, you must delete the old VPN and create a new one using the desired technology.

To start the Create VPN wizard, or to edit an existing VPN topology:

- To open the Create VPN wizard, in the [Site-to-Site VPN Manager Window](#) or the Site-to-Site VPN policy page (Device View), click the **Create VPN Topology (+)** button and select the type of VPN topology you want to create from the options that are displayed—Hub and Spoke, Point to Point, or Full Mesh. Use the Back and Next buttons to move through the pages; when finished, click Finish to create the topology.
- To open the Edit VPN dialog box, select the VPN topology in the Site-to-Site VPN Manager window or the Site-to-Site VPN policy page (Device View) and click the **Edit VPN Topology (pencil)** button.

The pages or tabs that appear and their sequence depend on the type of VPN topology you are creating, as explained in the following table.

**Table 24-4** Create/Edit VPN Wizard Pages

| Page                                                                                                                                                                                                                                            | Hub and Spoke VPN | Point to Point VPN | Full Mesh VPN                          |

| GET VPN Peers Page.<br>See <a href="#">Defining GET VPN Peers, page 24-57</a> .                                                                                                                                                                 | —                 | —                  | Step 4 (GET VPN only.)                 |
| VPN Defaults Page.<br>See <a href="#">Assigning Initial Policies (Defaults) to a New VPN Topology, page 24-58</a> .                                                                                                                             | Step 5            | Step 4             | Step 4 (Step 5 for GET VPN.)           |

**Table 24-4** Create/Edit VPN Wizard Pages (Continued)

| Page                                                                                                                                                                                                                                                       | Hub and Spoke VPN | Point to Point VPN | Full Mesh VPN          |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|--------------------|------------------------|
| Synchronize Keys dialog box. When completing the Create VPN wizard for a GET VPN, you are asked if you want to synchronize keys. Clicking <b>Yes</b> initiates the process.<br><br>See <a href="#">Generating and Synchronizing RSA Keys</a> , page 28-13. | —                 | —                  | Step 6 (GET VPN only.) |

Either during or after you create a VPN topology, you can also create the following advanced configurations when editing endpoints:

- VRF-Aware IPsec on a hub in a hub-and-spoke topology (see [Configuring VRF Aware IPsec Settings](#), page 24-46).
- A VPNSM or VPNSPA/VSPA on a Catalyst 6500/7600 in a hub-and-spoke, point-to-point, or full mesh VPN topology (see [Configuring VPNSM or VPN SPA/VSPA Endpoint Settings](#), page 24-41).
- A Firewall Services Module together with a VPN Services Module or VPN SPA on a Catalyst 6500/7600 device in a hub-and-spoke, point-to-point, or full mesh VPN topology (see [Configuring a Firewall Services Module \(FWSM\) Interface with VPNSM or VPNSPA/VSPA](#), page 24-45).

**Note**

You can create a visual representation of your VPN topology with all its elements in the Map view. For more information, see [Creating VPN Topologies in Map View](#), page 34-21.

## Defining the Name and IPsec Technology of a VPN Topology

**Note**

This topic does not apply to Extranet VPNs. For information about configuring the name of an Extranet VPN, see [Creating or Editing Extranet VPNs](#), page 24-63.

Use the Name and Technology page (or tab) of the Create VPN wizard and Edit VPN dialog box to define a name and description for the VPN topology. When creating a new topology, you must select the IPsec technology that will be assigned to it, but you cannot change the technology when editing an existing topology.

For information on opening the Create VPN wizard or Edit VPN dialog box, see [Creating or Editing VPN Topologies](#), page 24-28.

**Note**

If you are editing an existing VPN, the assigned IPsec technology and type is displayed, but you cannot change them. To change the technology or type, you must delete the topology and create a new one.

The following table describes the options you can configure when defining the name and technology.

**Table 24-5** *Name and Technology Page*

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name             | A unique name that identifies the VPN topology.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Description      | Information about the VPN topology.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| IPsec Technology | The IPsec technology used in the VPN topology: <ul style="list-style-type: none"> <li>• Regular IPsec</li> <li>• IPsec/GRE</li> <li>• DMVPN (Hub and Spoke VPN only)</li> <li>• Easy VPN (Hub and Spoke VPN only)</li> <li>• GET VPN (Full Mesh VPN only)</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Type             | The technology type if the selected IPsec technology is IPsec/GRE or DMVPN for a hub-and-spoke topology: <ul style="list-style-type: none"> <li>• IPsec/GRE—Select either <b>Standard</b> (for IPsec/GRE) or <b>Spokes with Dynamic IP</b> (for GRE Dynamic IP). For more information, see <a href="#">Understanding GRE Configuration for Dynamically Addressed Spokes, page 26-5</a>.</li> <li>• DMVPN—Select either <b>Standard</b> (for regular DMVPN) or <b>Large Scale with IPsec Terminator</b> (for a large scale DMVPN). For more information, see <a href="#">Configuring Large Scale DMVPNs, page 26-16</a>.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| IKE version      | <p>When configuring regular IPsec topologies, the Internet Key Exchange (IKE) version to allow in IKE negotiations. You can allow version 1 (<b>IKEv1</b>), version 2 (<b>IKEv2</b>), or both <b>IKEv1 &amp; IKEv2</b>.</p> <p>If you select <b>IKEv1 &amp; IKEv2</b>, IKEv1 is automatically used by any device that does not support IKEv2. However, if you select IKEv2 only, you must ensure that you do not select any devices that do not support IKEv2 (the wizard does not prevent an invalid selection). You can edit the IKE Proposal and IPsec Proposal policies to change which IKE versions are supported after creating the VPN if you select the wrong option.</p> <p>For information on IKE and how these versions differ, see <a href="#">Overview of IKE and IPsec Configurations, page 25-2</a>. For information on devices that support IKEv2, see <a href="#">Understanding Devices Supported by Each IPsec Technology, page 24-9</a>.</p> <p><b>Tip</b> When using the Create VPN wizard, if you select an option that allows IKEv2, the wizard never creates a valid topology. After completing the wizard, you must manually configure the IKEv2 Authentication policy to complete the configuration.</p> |

## Selecting Devices for Your VPN Topology

**Note**

This topic does not apply to Extranet VPNs. For information about selecting devices in an Extranet VPN, see [Creating or Editing Extranet VPNs, page 24-63](#).

Use the Device Selection page (or tab) of the Create VPN wizard and Edit VPN dialog box to select the devices to include in the VPN topology. The contents of this page differ depending on whether you are creating or editing a hub-and-spoke, large scale DMVPN, point-to-point, or full mesh VPN topology. Also, you cannot use this page to edit the membership in a GET VPN (instead, see [Configuring GET VPN Group Members, page 28-20](#) and [Configuring GET VPN Key Servers, page 28-18](#) when working with an existing GET VPN).

For information on opening the Create VPN wizard or Edit VPN dialog box, see [Creating or Editing VPN Topologies, page 24-28](#).

In most cases, the devices that are listed in the **Available Devices** list include only those that can be used for the selected VPN topology type, that support the IPsec technology type, and which you are authorized to view. In addition, the available devices depend on the selected IPsec technology—for example, if the IPsec technology is IPsec/GRE, GRE Dynamic IP, or DMVPN, PIX Firewalls and ASA devices are not displayed. However, the lists are not adjusted to account for the IKE versions you are supporting in the topology. For more information, see the supported platforms described in [Understanding Devices Supported by Each IPsec Technology, page 24-9](#).

**Tip**

When selecting devices, you can select a device group to select all of the eligible devices in the group.

The following list explains how to add or remove devices based on the type of topology:

- **To select devices for a full mesh VPN topology with Regular IPsec or IPsec/GRE technology,** select them in the Available Devices list and click >>.
- **To select devices for a full mesh VPN topology that uses the GET VPN technology:**
  - Select the devices that you want to define as key servers and click >> next to the **Key Servers** field.  
If you have more than one key server, use the **Up** and **Down** arrow buttons to ensure the primary key server is listed first. Group members register with the first key server in the list. If the first key server cannot be reached, they try to register with the second key server, and so on.
  - Select the devices that you want to define as group members and click >> next to the **Group Members** field.
- **To select devices for a hub-and-spoke VPN topology:**
  - Select the devices that you want to define as hubs (or servers in an Easy VPN configuration) and click >> next to the **Hubs** list.

If you have more than one hub, ensure the hubs list is in priority order with the primary hub listed first. To change the order, select a hub and click the **Up** and **Down** arrow buttons until the device is ordered as desired.

**Note**

You need to select the primary hub only when there are two or more IPsec terminators. When there is only one IPsec terminator, regardless of how many hubs are connected to the same IPsec terminator, it is not possible to designate one hub as the primary hub.

- Select the devices that you want to define as spokes (or clients in an Easy VPN configuration) and click >> next to the **Spokes** list.
- If you are configuring a **Large Scale DMVPN with IPsec Terminator** topology, you must also select the Catalyst 6500/7600 devices you want to be **IPsec Terminators** in your Large Scale DMVPN configuration. If you select more than one IPsec Terminator, use the **Up** and **Down** arrow buttons to put them in priority order. For more information, see [Configuring Large Scale DMVPNs, page 26-16](#).
- **To select devices for a point-to-point VPN topology:**
  - From the Devices list, select a device to be **Peer One** and click >>.
  - Select another device to be **Peer Two** and click >>.
- **To remove devices (any topology or technology combination),** select them from one of the selected devices lists and click << to move them back to the Available Devices list.

If you are editing an existing VPN topology, you can remove devices from the VPN topology, but you cannot save your changes if your device selections result in an invalid VPN configuration. When removing devices, you should be aware of the following:

- You cannot remove a device if it is the only hub in a hub-and-spoke VPN topology, unless you replace it with a different hub.
- You cannot remove a device that is one of the two devices in a point-to-point VPN topology, unless you replace it with a different device.
- In a VPN topology with multiple hub devices, deleting a hub causes the appropriate tunnels to be removed.
- If some, but not all, spokes in a VPN topology are deleted, the hub side crypto statements change to reflect the removal.
- GET VPNs must have at least one key server and one group member.

## Defining the Endpoints and Protected Networks

Use the Endpoints page of the Create VPN wizard and Edit VPN dialog box, or the Peers policy, to view the devices in your VPN topology and to define or edit their VPN characteristics and features. You are primarily defining the external or internal VPN interfaces and the protected networks for the devices in the VPN topology. The VPN interfaces are the interfaces that encrypt the data. The protected networks are the networks that are encrypted.

To get to the Endpoints page, do any of the following:

- Open the Create VPN wizard or the Edit VPN dialog box; for the procedure, see [Creating or Editing VPN Topologies, page 24-28](#).
- In the Site-to-Site VPN Manager, select the desired VPN topology (excepting GET VPN topologies) and select the **Peers** policy.

**Tips:**

- This configuration applies to all IPsec technology types except GET VPN. To configure GET VPN endpoints when creating the VPN, see [Defining GET VPN Peers, page 24-57](#). For existing GET VPNs, configure endpoints using the Key Servers and Group Members policies; see [Configuring GET VPN Key Servers, page 28-18](#) and [Configuring GET VPN Group Members, page 28-20](#).
- The devices listed on this page are selected in the Device Selection Page (see [Selecting Devices for Your VPN Topology, page 24-32](#)). You can change the list only when editing the Peers policy, where you can select a device and click the **Delete (trash can)** button to remove it. To add devices, you must edit the VPN topology itself.
- Although you can edit the endpoints for an Extranet VPN using the Peers policy, you should instead edit the endpoints through the Edit Extranet VPN dialog box by editing the VPN topology. The Endpoints page does not appear in the Create Extranet VPN wizard.

The table shows the role each device plays in the VPN (hub, spoke, peer, or IPsec Terminator), the device name, and the VPN interface and protected networks. Initially, the VPN interface and protected network is set to the default interface roles defined in the Security Manager Administrative settings for external and internal interfaces (see [VPN Policy Defaults Page, page 11-53](#)). The endpoint configuration might include configurations not shown in this table, but the VPN interface and protected network are the only required settings.

- To change the endpoint configuration for a device, select it and click the **Edit Row** button beneath the table. You can select more than one device to edit at a time, but the devices must serve the same role, and you cannot include Catalyst 6500/7600 devices or VPN service modules when selecting multiple devices. You perform endpoint editing in the Edit Endpoints Dialog Box, whose content differs depending on the selected device type and IPsec technology.

See the following topics for detailed information about the options you can configure in the Edit Endpoints dialog box:

- **VPN Interface tab**—To configure the VPN interface and other required interface settings (see [Configuring VPN Interface Endpoint Settings, page 24-35](#)). In some cases, you can also configure dial backup (for more information about dial backup, see [Configuring Dial Backup, page 24-39](#)).

For Catalyst 6500/7600 devices, the VPN Interface tab provides settings that enable you to configure a VPN Services Module (VPNSM) or a VPNSPA/VSPA blade on the device (which might be an IPsec Terminator in a large scale DMVPN), and are described in [Configuring VPNSM or VPN SPA/VSPA Endpoint Settings, page 24-41](#).

- **Extranet Device Details**—To configure the endpoint settings for the remote (unmanaged) device in an Extranet VPN. The tab appears in the Peers policy only. Instead of editing the information on this tab, the preferred method is to edit the VPN topology and change the settings there. For more information, see [Creating or Editing Extranet VPNs, page 24-63](#).
- **Hub Interface tab**—If the selected device is a hub in a large scale DMVPN, specify the interface that is connected to the IPsec Terminator. See [Configuring Large Scale DMVPNs, page 26-16](#).
- **Protected Networks tab**—To define the networks that are encrypted (see [Identifying the Protected Networks for Endpoints, page 24-45](#)). The protected network can be an interface role, network/host group object, or in the case of regular IPsec, an ACL policy object.
- **FWSM tab**—To define the settings that enable you to connect between a Firewall Services Module (FWSM) and an IPsec VPN Services Module (VPNSM) or VPNSPA/VSPA that is already configured on a Catalyst 6500/7600 device. This is possible only in a hub-and-spoke

topology where the hub is a Catalyst 6500/7600 device that has these modules installed. For more information, see [Configuring a Firewall Services Module \(FWSM\) Interface with VPNSM or VPNSPA/VSPA, page 24-45](#).

- **VRF Aware IPsec tab**—To configure a VRF-Aware IPsec policy on a hub (IPsec Aggregator) in a hub-and-spoke VPN topology. For more information, see [Configuring VRF Aware IPsec Settings, page 24-46](#) and [Understanding VRF-Aware IPsec, page 24-14](#).
- To view the actual interfaces associated with an interface role for each device, select **Matching Interfaces** in the **Show** list beneath the table. If there are no matching interfaces, “No Match” is displayed. The default is to show the interface role policy object names. To create a valid VPN, these roles must match to actual interfaces defined on the device.

## Configuring VPN Interface Endpoint Settings

Use the VPN Interface tab in the Edit Endpoints dialog box to edit the VPN interfaces defined for devices in the Endpoints table. When defining a primary VPN interface for a router device, you can also configure a backup interface to use as a fallback link for the primary route VPN interface, if its connection link becomes unavailable. You can configure a backup interface on a Cisco IOS security router, that is in a point-to-point or full mesh topology, or that is a spoke in a hub-and-spoke topology, or is a remote client in an Easy VPN topology. For more information, see [Configuring Dial Backup, page 24-39](#).

#### Tips

- If the device is a hub in a large scale DMVPN, this tab is called **Hub Interface**. Specify the interface that is connected to the IPsec Terminator in the **Hub Interface Toward the IPsec Terminator** field. Enter the name of the interface or interface role, or click **Select** to select it from a list. For more information, see [Configuring Large Scale DMVPNs, page 26-16](#).
- If the device is a Catalyst 6500/7600 device, the VPN Interface tab provides settings that enable you to configure a VPN Services Module (VPNSM) or a VPNSPA/VSPA blade on the device. For a description of the elements that appear on the VPN Interface tab for a Catalyst 6500/7600 device, see [Configuring VPNSM or VPN SPA/VSPA Endpoint Settings, page 24-41](#). The table below assumes the device is not a Catalyst 6500/7600 device.

#### Navigation Path

On the Endpoints Page of the Create VPN wizard or Edit VPN dialog box, or on the VPN Peers policy, select a device and click **Edit** to open the Edit Endpoints Dialog Box. Select the **VPN Interfaces** tab in the Edit Endpoints dialog box. For information on how to access these pages and dialog boxes, see [Defining the Endpoints and Protected Networks, page 24-33](#).

## Configuring Dial Backup

You can use dial backup to provide a fallback link for a primary, direct connection when the primary link becomes unavailable. You can configure dial backup on Cisco IOS security routers that participate in a point-to-point, Extranet, or full mesh VPN topology, or that are spokes in a hub-and-spoke topology. You can also configure it on a remote client router running IOS version 12.3(14)T+ in an Easy VPN topology.

Implementation of the dial backup feature is based on the assumption that two static routes exist:

- A primary route through a primary gateway, which has highest priority.
- A secondary route through a secondary gateway, which has lower priority and only appears in the routing table when the primary gateway is down.

Security Manager configures a logical dialer interface on the spoke. The dialer interface is associated with a physical backup interface. When the primary route is down, the dialer interface is activated and traffic is redirected through this backup interface along the secondary route. To ensure that the spoke-hub traffic is encrypted, Security Manager applies a crypto map to the dialer interface. This crypto map is identical to the crypto map on the VPN interface (the primary route interface). In Easy VPN, the backup configuration is attached to the dialer interface.

Depending on the IOS version, Response Time Reporter (RTR) or Service Level Agreement (SLA) IOS technology is used to detect loss of network performance on the primary route. If the assigned IPsec technology is DMVPN, Dialer Watch-List (DWL) is used.

ISDN Basic Rate Interface (BRI) and analog modem interfaces can be configured as backup interfaces to other primary interfaces. In such a case, an ISDN or analog modem connection is made if the primary interface goes down. Should the primary interface and connection go down, the ISDN or analog modem interface immediately dials out to establish a connection so that network services are not lost.

### Before You Begin

- Configure the dialer interface settings on the Cisco IOS routers. This requires defining the relationship between the physical BRI and Async interfaces, and the virtual dialer interfaces used when configuring dial backup. For more information, see [Dialer Interfaces on Cisco IOS Routers, page 59-27](#).
- Make sure that the primary route is functioning.
- For Extranet VPNs, you can configure dial backup on the local (managed) device only.

---

**Step 1** For most VPN topologies, you configure dial backup when creating or editing a site-to-site VPN. You can also edit the Peers policy for existing VPN topologies. For Extranet VPNs, you configure dial backup through the Peers policy only.

Do one of the following:

- In the Create VPN wizard, proceed to the Endpoints page (see [Creating or Editing VPN Topologies, page 24-28](#) and [Defining the Endpoints and Protected Networks, page 24-33](#)).
- In the Edit VPN dialog box, click the **Endpoints** tab (see [Creating or Editing VPN Topologies, page 24-28](#) and [Defining the Endpoints and Protected Networks, page 24-33](#)).
- For Extranet VPNs, or for editing any other VPN topology, select the Peers policy. For general information on editing endpoints, see [Defining the Endpoints and Protected Networks, page 24-33](#).

**Step 2** Select the router on which you want to configure dial backup and click the **Edit (pencil)** button. If there is more than one router that will have the same dialer configuration, you can select and edit them all at once.

This action opens the Edit Endpoints dialog box. Select the **VPN Interface** tab if it is not already selected.

**Step 3** On the VPN Interface tab, configure the following options related to dial backup. If you are creating a new VPN, you need to configure the other settings (such as VPN interface) as well. For detailed reference information for these options, see [Configuring VPN Interface Endpoint Settings, page 24-35](#).

- **Enable Backup**—Select this option.
- **Dialer Interface**—Specify the physical interface through which the secondary route traffic will be directed when the logical dialer interface is activated.
- **Primary Next Hop IP Address**—If the selected IPsec technology is Regular IPsec, IPsec/GRE, GRE Dynamic IP, or Easy VPN, enter the next hop IP address. If you do not enter the next hop IP address, Security Manager configures a static route using the interface name.
- **Tracking IP Address**—Specify the IP address of the destination device to which connectivity must be maintained from the primary VPN interface connection. This is the device that is pinged through the primary route to track connectivity. The backup connection is triggered if connectivity to this device is lost.

If you do not specify an IP address, the primary hub VPN interface is used in a hub-and-spoke or Easy VPN topology. In a point-to-point or full mesh VPN topology, the peer VPN interface is used.

**Step 4** If the selected IPsec technology is Regular IPsec, IPsec/GRE, GRE Dynamic IP, or Easy VPN, click **Advanced** to configure additional (optional) settings in the Dial Backup Settings dialog box. These settings are explained in [Dial Backup Settings Dialog Box, page 24-40](#). Click **OK** to save your changes.

**Step 5** Click **OK** in the Edit Endpoints dialog box.

## Dial Backup Settings Dialog Box

Use the Dial Backup Settings dialog box to define optional settings for configuring a dial backup policy for your site-to-site VPN. These settings are available for Regular IPsec, IPsec/GRE, GRE Dynamic IP, or Easy VPN technologies.

Mandatory settings for dial backup are configured in the VPN Interface tab on the Edit Endpoints dialog box. See [Configuring VPN Interface Endpoint Settings, page 24-35](#).

### Note

You must configure the dialer interface settings before dial backup can work properly. For more information, see [Dialer Interfaces on Cisco IOS Routers, page 59-27](#).

### Navigation Path

To open the Dial Backup Settings dialog box, enable dial backup and click **Advanced** on the **VPN Interface** tab of the Edit Endpoints dialog box. For information on opening the Edit Endpoints dialog box, see [Defining the Endpoints and Protected Networks, page 24-33](#).

| Next Hop Forwarding<br>Backup Next Hop IP Address | If required, enter the next hop IP address of the ISDN BRI or analog modem backup interface (that is, the IP address to which the backup interface will connect when it is active). You can enter an IP address or the name of a network/host object, or click Select to select a network/host object that specifies the IP address.<br><br>If you do not enter the next hop IP address, Security Manager configures a static route using the interface name. |
| <b>Tracking Object Settings</b>                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Timeout                                           | The number of milliseconds the Service Assurance Agent operation waits to receive a response from the destination device. The default is 5000 ms.                                                                                                                                                                                                                                                                                                             |
| Frequency                                         | How often Response Time Reporter (RTR) should be used to detect loss of performance on the primary route. The default is every 60 seconds.                                                                                                                                                                                                                                                                                                                    |
| Threshold                                         | The rising threshold in milliseconds that generates a reaction event and stores history information for the RTR operation. The default is 5000 ms.                                                                                                                                                                                                                                                                                                            |

**Configuring VPNSM or VPN SPA/VSPA Endpoint Settings**

When you select a Catalyst 6500/7600 device in the Endpoints table for editing, the VPN Interface tab of the Edit Endpoints dialog box provides settings for configuring Cisco VPN Services Modules (VPNSM), Cisco VPN Shared Port Adapters (VPN SPAs), and Cisco VPN Service Port Adapters (VSPAs) on the device. You can select more than one Catalyst 6500/7600 device at the same time. Your changes are applied to all the selected devices.

The device can be in a point-to-point or full mesh VPN topology, or a hub or spoke in a hub-and-spoke VPN topology managed by Security Manager (except in an Easy VPN configuration, where the device cannot be a spoke). These settings must also be configured if the selected device is an IPsec Terminator in a large scale DMVPN, although not all settings described below are available. See [Configuring Large Scale DMVPNs](#), page 26-16.

**General Notes**

- A Catalyst 6500/7600 device can contain from 3 to 13 chassis slots. Due to the design of the blades, you can install one VPNSM or two VPNSPA/VSPA per slot. The location of a VPNSPA/VSPA is identified with a slot and subslot number. Security Manager stores this information in its inventory, so that Security Manager can manage the VPN topologies.
- If you are configuring intra-chassis high availability, you cannot use a VPNSM blade and a VPNSPA/VSPA blade on the same device as primary and failover blades.
- In a remote access VPN, you can configure only one failover unit for each IPsec proposal. See [VPNSM/VPN SPA/VSPA Settings Dialog Box](#), page 32-6.
- If the Catalyst 6500/7600 has a Firewall Services Module (FWSM), you can configure it to work with these modules. For more information, see [Configuring a Firewall Services Module \(FWSM\) Interface with VPNSM or VPNSPA/VSPA](#), page 24-45.

- If you are configuring a VPNSM or VPNSPA/VSPA with VRF-Aware IPsec on a device, the device cannot belong to a different VPN topology in which VRF-Aware IPsec is not configured. For more information, see [Configuring VRF Aware IPsec Settings, page 24-46](#).
- Create an inside VLAN on the Catalyst 6500/7600 device, or edit an existing port or VLAN configuration. If the device is configured with VRF-Aware IPsec, you must create a forwarding VLAN.

#### Notes for VPNSMs

- Security Manager supports the configuration of multiple VPNSMs on a Catalyst 6500/7600 device, but only one module (or two if you are configuring intra chassis high availability) can be configured per VPN topology.
- VPNSM configuration requires that its parent Catalyst 6500/7600 device is running Cisco IOS Software release 12.2(18)SXD1 and later.
- You can use only Layer 3 VLANs for VPNSM configuration.

#### Notes for VPNSPA/VSPAs

- This configuration also applies if you are configuring an IPsec Terminator in a large scale DMVPN configuration. For more information, see [Configuring Large Scale DMVPNs, page 26-16](#).
- The VPN SPA supports the AES encryption algorithm for all key sizes (128-, 192-, and 256-bit), as well as the DES and 3DES encryption algorithms. For more information, see [Deciding Which Encryption Algorithm to Use, page 25-6](#).

In VRF mode, the **crypto engine slot slot/subslot {inside | outside}** command is deployed on the inside and outside VPN interfaces.

- Make sure that the Catalyst 6500/7600 device is running Cisco IOS Software release 12.2(18)SXE2 or later.
- If you plan to use Crypto Connect Alternate mode (whereby encrypted traffic entering the VPNSM/VPN SPA is passed through and clear text traffic is bypassed), the Catalyst 6500 device must be running Cisco IOS Software version 12.2(33)SXH or later, and the 7600 router must be running 12.2(33)SRA or later.
- In the case of a DMVPN topology in which multiple hubs participate, if one hub is configured with a VPN SPA blade, a tunnel key must not be configured on *any* of the devices, whether they are spokes or hubs. Devices that participate in such a topology must be running Cisco IOS Software version 12.3T and later in order to support tunnels without keys.

#### Navigation Path

On the Endpoints Page of the Create VPN wizard or Edit VPN dialog box, or on the VPN Peers policy, select a Catalyst 6500/7600 device, then click **Edit** to open the Edit Endpoints Dialog Box. Select the **FWSM** tab in the Edit Endpoints dialog box. For information on how to access these pages and dialog boxes, see [Defining the Endpoints and Protected Networks, page 24-33](#).

| Tunnel Source                | <p><b>Note</b> Available only for a hub when the selected technology is IPsec/GRE or DMVPN.</p> <p>Specifies the tunnel source address to be used by the GRE or DMVPN tunnel on the spoke side. You can select one of the following options:</p> <ul style="list-style-type: none"> <li>• <b>Override Unique Tunnel Source per Tunnel Interface</b>—If you have enabled the setting to use a unique tunnel source per tunnel interface in the GRE Modes &gt; Tunnel Parameters tab, this option is available. Select this option to specify a different tunnel source for the selected device.</li> <li>• <b>Outside VLAN/External Port (When CCA/VRF is Enabled)</b>—When the <b>Use Crypto Connect Alternate</b> check box is selected, this radio button is available. When selected, specifies the outside VLAN/external port as the tunnel source.</li> <li>• <b>Inside VLAN</b>—When selected, uses the interface configured for the inside VLAN as the tunnel source.</li> <li>• <b>Interface</b>—To use any interface as the tunnel source address, not necessarily a VPN interface, enter the interface name or click <b>Select</b> to select an interface role that identifies the interface. You can create new roles from the selection list.</li> </ul> |
| Local Peer IPsec Termination | <p>Define the IPsec termination point of the VPN interface on the local router:</p> <ul style="list-style-type: none"> <li>• <b>Inside VLAN</b>—Use the interface configured as the inside VLAN.</li> <li>• <b>IP Address</b>—Use the IP address of the VPN interface on the local router. Enter the IP address.</li> </ul> <p><b>Note</b> If you select a tunnel source as the VPN interface, it is likely that the VPN interface has a dynamically assigned IP address.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Enable Failover Blade        | <p>Whether to configure a failover VPNSM or VPNSPA/VSPA blade for intra-chassis high availability.</p> <p><b>Note</b> A VPNSM and VPNSPA/VSPA blade cannot be used on the same device as primary and failover blades.</p> <p>Specify the failover blade, as follows:</p> <ul style="list-style-type: none"> <li>• <b>Slot</b>—The slot number that identifies where the VPNSM blade or VPNSPA/VSPA blade is located.</li> <li>• <b>Subslot</b>—If you are configuring a VPNSPA/VSPA, select the number of the subslot (0 or 1) on which the failover VPN SPA blade is installed.</li> </ul> <p><b>Note</b> If you are configuring a VPNSM, select the blank option.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Identifying the Protected Networks for Endpoints

Use the Protected Networks tab on the Edit Endpoints dialog box to edit the protected networks that are defined on devices in the Endpoints table. (See [Defining the Endpoints and Protected Networks, page 24-33](#).)

You can specify the protected networks as interface roles whose naming patterns match the internal VPN interface of the device, as network/host group objects containing one or more network or host IP addresses, interfaces, or other network objects, or as access control list objects (if Regular IPsec is the assigned technology).

- If you are editing more than one device at a time, select **Enable the Protected Networks Changes on All Selected Peers** to apply any changes you make in the Protected Networks tab to all the selected devices.
- To add a protected network, select it from the Available Protected Networks list and click >> to move it to the Selected Protected Networks list. You can use any combination of interface role objects, network/host group objects (listed in the Protected Networks folder), or Access Control List objects to define the protected network for the device. (ACL objects are available only if Regular IPsec is the assigned technology.)

---

**Note** In a hub-and-spoke VPN topology in which Regular IPsec is the assigned technology, when an ACL object is used to define the protected network on a spoke, Security Manager mirrors the spoke's ACL object on the hub to the matching crypto map entry.

---

- To remove a selected protected network, select it and click the << button.
- If the order of the objects matters, you can adjust the priority order of the selected objects using the Move Up, Move Down buttons to position the objects in the selected list as desired. These buttons are not available if order does not matter.
- If an object that you need to define the protected network is not listed, click the **Create (+)** button to add the object; you are prompted to select the type of object you want to add. You can also modify the definition of an existing object by selecting it and clicking the **Edit (pencil)** button. For more information, see the following topics:
  - [Understanding Interface Role Objects, page 6-67](#) and [Creating Interface Role Objects, page 6-68](#).
  - [Understanding Networks/Hosts Objects, page 6-74](#) and [Creating Networks/Hosts Objects, page 6-76](#).
  - [Creating Access Control List Objects, page 6-49](#).

### Navigation Path

On the Endpoints Page of the Create VPN wizard or Edit VPN dialog box, or on the Peers policy, select a device and click **Edit** to open the Edit Endpoints Dialog Box. Select the **Protected Networks** tab in the Edit Endpoints dialog box. For information on how to access these pages and dialog boxes, see [Defining the Endpoints and Protected Networks, page 24-33](#).

## Configuring a Firewall Services Module (FWSM) Interface with VPNSM or VPNSPA/VSPA

Security Manager supports the configuration of a Firewall Services Module (FWSM) with an IPsec VPN Services Module (VPNSM) or VPNSPA/VSPA on a Catalyst 6500/7600 device. This feature enables a FWSM to apply firewall policies to untrusted clients, while the VPNSM or VPN SPA/VSPA provides secure access to the internal network.

Use the FWSM tab on the Edit Endpoints dialog box to define the settings that enable you to connect between the FWSM and a VPNSM or VPNSPA/VSPA that is already configured on a Catalyst 6500/7600 device. The FWSM tab is available only in a hub-and-spoke VPN topology when the selected hub is a Catalyst 6500/7600 device.

#### Tips

- Before you can define the FWSM settings, you must add the hosting Catalyst 6500/7600 device to the Security Manager inventory and discover its FWSM and its policies and security contexts. See [Adding Devices from the Network, page 3-11](#) and [Managing Security Contexts, page 57-4](#).
- If an inside interface is not already created on the Catalyst 6500/7600 device, you must create it (see [Creating or Editing VLANs, page 65-26](#)). Then, you must assign the FWSM inside interface (VLAN) to the appropriate security context, or directly to the FWSM blade.
- You also must configure the settings on the VPN Interfaces tab related to IPsec VPN Services Module (VPNSM) or VPNSPA/VSPA. For more information, see [Configuring VPNSM or VPN SPA/VSPA Endpoint Settings, page 24-41](#).

#### Navigation Path

On the Endpoints Page of the Create VPN wizard or **Edit** VPN dialog box, or on the VPN Peers policy, select a Catalyst 6500/7600 device that contains an FWSM, then click **Edit** to open the Edit Endpoints Dialog Box. Select the **FWSM** tab in the Edit Endpoints dialog box. For information on how to access these pages and dialog boxes, see [Defining the Endpoints and Protected Networks, page 24-33](#).

#### Field Reference

**Table 24-9** *Edit Endpoints Dialog Box, FWSM Tab*

| Element              | Description                                                                                                                                                                                                                       |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable FWSM Settings | Whether you want to configure the connection between the Firewall Services Module (FWSM) and the VPN Services Module (VPNSM) or VPN SPA on the Catalyst 6500/7600 device.                                                         |
| FWSM Inside VLAN     | The VLAN that serves as the inside interface to the Firewall Services Module (FWSM). Enter the name of the interface or interface role, or click <b>Select</b> to select it from a list or to create a new interface role object. |
| FWSM Blade           | From the list of available blades, select the blade number to which the selected FWSM inside VLAN interface is connected.                                                                                                         |
| Security Context     | If the FWSM inside VLAN is part of a security context (that is, the FWSM is running in multiple-context mode), specify the security context name in this field. The name is case-sensitive.                                       |

## Configuring VRF Aware IPsec Settings

Use the VRF-Aware IPsec tab on the Edit Endpoints dialog box to configure a VRF-Aware IPsec policy on a hub in your hub-and-spoke VPN topology. You can configure VRF-Aware IPsec as a one-box or two-box solution. For more information about VRF-Aware IPsec, see [Understanding VRF-Aware IPsec, page 24-14](#).

#### Tips

- VRF-Aware IPsec can be configured only on hubs in a hub-and-spoke VPN topology.

- In a VPN topology with two hubs, you must configure VRF-Aware IPsec on both devices.
- You cannot configure VRF-Aware IPsec on a device that belongs to another VPN topology in which VRF-Aware IPsec is not configured.
- You cannot configure VRF-Aware IPsec on hubs that have been configured with high availability. See [Configuring High Availability in Your VPN Topology, page 24-49](#).
- Deployment might fail if the IPsec Aggregator is configured with the same **keyring** CLI command as the existing preshared key (keyring) command, and is not referenced by any other command. In this case, Security Manager does not use the VRF keyring CLI, but generates the keyring with a different name, causing deployment to fail. You must manually remove the preshared key keyring command through the CLI before you can deploy the configuration.

### Navigation Path

On the Endpoints Page of the Create VPN wizard or Edit VPN dialog box, or on the VPN Peers policy, select a device that supports VRF-Aware IPsec configuration in a hub-and-spoke topology, and click **Edit** to open the Edit Endpoints Dialog Box. Select the **VRF-Aware IPsec** tab in the Edit Endpoints dialog box. For information on how to access these pages and dialog boxes, see [Defining the Endpoints and Protected Networks, page 24-33](#) and [Creating or Editing VPN Topologies, page 24-28](#).

|-----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Route Distinguisher                                       | <p>The unique identifier of the VRF routing table on the IPsec Aggregator. This unique route distinguisher maintains the routing separation for each VPN across the MPLS core to the other PE routers.</p> <p>The identifier can be in either of the following formats:</p> <ul style="list-style-type: none"> <li>• <i>IP address:X</i> (where <i>X</i> is in the range 0- 2147483647).</li> <li>• <i>N:X</i> (where <i>N</i> is in the range 0-65535, and <i>X</i> is in the range 0-2147483647).</li> </ul> <p><b>Note</b> You cannot override the RD identifier after deploying the VRF configuration to your device. To modify the RD identifier after deployment, you must manually remove it using the device CLI, and then deploy again.</p> |
| Interface Towards Provider Edge<br>(2-Box solution only.) | <p>The VRF forwarding interface on the IPsec Aggregator towards the PE device. If the IPsec Aggregator (hub) is a Catalyst VPN service module, you must specify a VLAN.</p> <p>Enter the name of the interface or interface role object, or click <b>Select</b> to select it from a list or to create a new interface role object.</p>                                                                                                                                                                                                                                                                                                                                                                                                               |
| Routing Protocol<br>(2-Box solution only.)                | <p>The routing protocol to be used between the IPsec Aggregator and the PE. The options are BGP, EIGRP, OSPF, RIPv2, or Static route. The default is BGP.</p> <p>If the routing protocol used for the secured IGP differs from the routing protocol between the IPsec Aggregator and the PE, select the routing protocol to use for redistributing the routing to the secured IGP.</p> <p>For information about protocols, see <a href="#">Chapter 58, “Managing Routers”</a>.</p> <p><b>Note</b> In a one-box solution, these fields are unavailable as you do not need to specify the routing protocol and AS number. In the one-box solution, only the BGP protocol is supported.</p>                                                             |
| AS Number<br>(2-Box solution, BGP or EIGRP routing only.) | <p>The number that will be used to identify the autonomous system (AS) area between the IPsec Aggregator and the PE. The AS number must be within the range 1-65535.</p> <p>If the routing protocol used for the secured IGP differs from the routing protocol between the IPsec Aggregator and the PE, enter an AS number that will be used to identify the secured IGP into which the routing will be redistributed from the IPsec Aggregator and the PE. This is relevant only when IPsec/GRE or DMVPN are applied.</p>                                                                                                                                                                                                                           |
| Process Number<br>(2-Box solution, OSPF routing only.)    | <p>The routing process ID number that will be used to identify the secured IGP if you are using OSPF routing.</p> <p>The range is 1-65535.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| OSPF Area ID<br>(2-Box solution, OSPF routing only.)      | <p>The ID number of the area in which the packet belongs. You can enter any number from 0-4294967295.</p> <p><b>Note</b> All OSPF packets are associated with a single area, so all devices must have the same area ID number.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 24-10** Edit Endpoints Dialog Box, VRF Aware IPsec Tab (Continued)

| Element                                                                 | Description                                                                                                                           |
|-------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| Next Hop IP Address<br>(2-Box solution, static routing only.)           | The IP address of the Provider Edge (PE) or the interface that is connected to the IPsec Aggregator, if you are using static routing. |
| Redistribute Static Route<br>(2-Box solution, non-static routing only.) | Whether to have static routes advertised in the routing protocol configured on the IPsec Aggregator towards the PE device.            |

## Configuring High Availability in Your VPN Topology

Use the High Availability page of the Create VPN wizard and Edit VPN dialog box to define a group of hubs as a high availability (HA) group. Configuring high availability is optional.

For information on opening the Create VPN wizard or Edit VPN dialog box, see [Creating or Editing VPN Topologies, page 24-28](#).

High Availability (HA) policies provide automatic device backup when configured on Cisco IOS routers or Catalyst 6500/7600 devices that run IP over LANs. You can configure high availability in a hub-and-spoke VPN topology that uses Regular IPsec or Easy VPN technologies.

In Security Manager, HA is supported by an HA group made up of two or more hub devices that use Hot Standby Routing Protocol (HSRP) to provide transparent, automatic device failover. By sharing a virtual IP address, the hubs in the HA group present the appearance of a single virtual device or default gateway to the hosts on a LAN. One hub in the HA group is always active and assumes the virtual IP address, while the others are standby hubs. The hubs in the group watch for hello packets from active and standby devices. If the active device becomes unavailable for any reason, a standby hub takes ownership of the virtual IP address and takes over the hub functionality. This transfer is seamless and transparent to hosts on the LAN and to the peering devices.

Keep the following points in mind when working with HA groups:

- You can configure High Availability only on hubs in a hub-and-spoke VPN topology that uses Regular IPsec or Easy VPN technologies.
- You can configure high availability only on Cisco IOS routers or Catalyst 6500/7600 devices; however, an HA group cannot contain both Cisco IOS routers and Catalyst 6500/7600 devices.
- If you want to configure stateful failover, the HA group can contain only two hubs, and they must be Cisco IOS routers. You cannot use Catalyst 6500/7600 devices.
- You cannot configure High Availability on hubs that have been configured with VRF-Aware IPsec. See [Understanding VRF-Aware IPsec, page 24-14](#).
- You cannot configure GRE on an HA group.
- A device in an HA group can belong to more than one hub-and-spoke topology.
- A device configured as a hub in a site-to-site VPN with an HA configuration cannot be configured as a hub in a different site-to-site VPN with an HA configuration using the same outside interface. Similarly, such a device cannot be configured as a remote access VPN server on which HA is configured using the same outside interface.

- The same auto-generated preshared key must be used for authentication on all peers. If you specified not to use this option when configuring a preshared key policy, this is overridden during configuration of High Availability. For more information, see [Configuring IKEv1 Preshared Key Policies, page 25-44](#).
- During generation of configurations, all hubs in the HA group receive the same commands, which must be deployed to the HA group as a unit. You cannot deploy to individual hubs in the group.

The following table describes the options for configuring high availability.

**Table 24-11 High Availability Page**

| Element                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable                         | Whether to enable high availability configuration on a group of hubs. If you already configured high availability, you can remove the configuration by deselecting this option.                                                                                                                                                                                                                                                                                                                  |
| Inside Virtual IP              | The IP address that is shared by the hubs in the HA group and that represents the inside interface of the HA group. The virtual IP address must be on the same subnet as the inside interfaces of the hubs in the HA group, but must not be identical to the IP address of any of these interfaces.<br><br><b>Note</b> If there is an existing standby group on the device, make sure that the IP address you provide is different from the virtual IP address already configured on the device. |
| Inside Mask                    | The subnet mask for the inside virtual IP address.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| VPN Virtual IP                 | The IP address that is shared by the hubs in the HA group and represents the VPN interface of the HA group. This IP address serves as the hub endpoint of the VPN tunnel.<br><br><b>Note</b> If there is an existing standby group on the device, make sure that the IP address you provide is different from the virtual IP address already configured on the device.                                                                                                                           |
| VPN Mask                       | The subnet mask for the VPN virtual IP address.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Hello Interval                 | The duration in seconds (within the range of 1-254) between each hello message sent by a hub to the other hubs in the group to indicate status and priority. The default is 5 seconds.                                                                                                                                                                                                                                                                                                           |
| Hold Time                      | The duration in seconds (within the range of 2-255) that a standby hub will wait to receive a hello message from the active hub before concluding that the hub is down. The default is 15 seconds.                                                                                                                                                                                                                                                                                               |
| Standby Group Number (Inside)  | The standby number of the inside hub interface that matches the internal virtual IP subnet for the hubs in the HA group. The number must be within the range of 0-255. The default is 1.                                                                                                                                                                                                                                                                                                         |
| Standby Group Number (Outside) | The standby number of the outside hub interface that matches the external virtual IP subnet for the hubs in the HA group. The number must be within the range of 0-255. The default is 2.<br><br><b>Note</b> The outside standby group number must be different from the inside standby group number.                                                                                                                                                                                            |

|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Stateful Failover | <p>Whether to enable stateful failover, which uses Stateful SwitchOver (SSO) to ensure that state information is shared between the HSRP devices in the HA group. If a device fails, the shared state information enables the standby device to maintain IPsec sessions without having to re-establish the tunnel or renegotiate the security associations.</p> <p>You can configure stateful failover only on an HA group that contains two hubs that are Cisco IOS routers. This check box is disabled if the HA group contains more than two hubs.</p> <p>In an Easy VPN topology, this check box appears selected and disabled, as stateful failover must always be configured.</p> <p><b>Tips:</b></p> <ul style="list-style-type: none"> <li>• When deselected in a Regular IPsec topology, stateless failover is configured on the HA group. Stateless failover will also be configured if the HA group contains more than two hubs. You can configure stateless failover on Cisco IOS routers or Catalyst 6500/7600 devices.</li> <li>• Stateful failover cannot be used when RSA Signature is the IKE authentication method.</li> <li>• Stateful failover can be configured together with PKI configuration, but only on devices with Cisco IOS version 12.3(14)T and later.</li> </ul> |

## Defining GET VPN Group Encryption

Use the GET VPN Group Encryption page to define the group settings and security associations for a GET VPN topology.

The contents of this page differ depending on whether you are using the Create VPN wizard or you are editing the Group Encryption Policy. The wizard page is not tabbed, whereas the policy is tabbed. There is an extra field on the wizard page to allow the security association configuration.

To open the GET VPN Group Encryption page:

- When creating a new GET VPN, use the Create VPN wizard. For information on starting the wizard, see [Creating or Editing VPN Topologies, page 24-28](#).
- ([Site-to-Site VPN Manager Window](#)) Select an existing GET VPN topology and then select **Group Encryption Policy** in the Policies selector.
- (Policy view) Select **Site-to-Site VPN > Group Encryption Policy**, and then select an existing policy or create a new one.

The following table describes the options you can configure when defining the GET VPN group encryption settings.

Table 24-12 GET VPN Group Encryption Policy Page

| Element                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Group Name                                   | The name of the Group Name of Interpretation (GDOI) group. This name is the same as a VPN name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Group Identity                               | A parameter that is used to identify the group. All key servers and group members use this parameter to identify with the group.<br>The identity can be either a number (such as 3333) or any IP address (such as the multicast address used for rekey).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Receive Only                                 | If enabled, group members decrypt traffic and forward it in clear text. This feature is useful for testing the VPN. In normal operation, ensure that this option is not selected. For detailed information, see <a href="#">Using Passive Mode to Migrate to GET VPN, page 28-23</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Security Policy<br>(Create VPN wizard only.) | An ACL policy object to be used as the security policy. For a detailed explanation of the contents of this object and how it relates to the group member security policy, see <a href="#">Understanding the GET VPN Security Policy and Security Associations, page 28-10</a> .<br>This field appears only if you are using the Create VPN wizard. In the Group Encryption Policy, you configure the security policy on the Security Associations tab (described below).<br><b>Note</b> If you are using multicast as the method to distribute the keys, then the ACL policy object must contain a deny rule (ACE) for the multicast address. In this way, the rekey packets sent using multicast will not be encrypted by the TEK. This statement allows the group members to receive rekey packets sent using the multicast protocol.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Authorization Type                           | The type of authorization mechanism used by the group: None, Certificates, or Preshared Key. Selecting Certificates or Preshared Key provides additional security in allowing only authorized group members to register with the key server. This type of additional security is required when a key server serves multiple GDOI groups.<br>If you select <b>Certificates</b> , you must create a list of certificate filters (using some combination of distinguished name or full-qualified domain name attributes). This filter, located on the key server, specifies the attributes and values used to validate whether the group member is authorized to join the GDOI group. Enter a name for the certificate filter, click the <b>Add Row (+)</b> button, and fill in the <a href="#">Add Certificate Filter Dialog Box, page 24-54</a> .<br><b>Note</b> To configure certificate authorization, you must also configure a Public Key Infrastructure (PKI) policy for the GET VPN. The PKI enrollment object that you use should define the same distinguished names, or include the device's fully-qualified domain name, as appropriate.<br>If you select <b>Preshared Key</b> , also select an ACL policy object to identify the authorized group members. Use permit rules to identify the host or network addresses of group members. |

**Table 24-12** GET VPN Group Encryption Policy Page (Continued)

| Element              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Key Distribution     | <p>The transport method to be used to distribute keys to each group member, either unicast or multicast. For help deciding which to use, see <a href="#">Choosing the Rekey Transport Mechanism, page 28-6</a>.</p> <p>If you select <b>unicast</b>, the key server sends a rekey message to each registered group member and waits for an acknowledgment. If you select multicast, the key server sends a rekey message to all group members at once and does not wait for acknowledgment. Rekey messages are retransmitted after the retransmit interval configured in this policy.</p> <p>If you select <b>multicast</b>, make sure that the router used as the key server is multicast enabled, and also configure the following options:</p> <ul style="list-style-type: none"> <li>• <b>Group IP Address</b>—The IP address of the multicast group to be used for key distribution.</li> <li>• <b>Use Static IGMP Joins on Group Members</b>—If you select this option, the static Source Specific Multicast (SSM) mappings are enabled, which reveal the source of multicast traffic to the group member. In the case of GET VPN, the group member learns the key server address.</li> </ul> |
| RSA Key Label        | <p>The label for the RSA key, which is used to encrypt a variety of messages. This key can either already exist on the device, or it can be an unused new label.</p> <p>If you are creating a new VPN, you are asked at the end of the Create VPN wizard whether you want this key synchronized among the key servers; if you click <b>Yes</b>, Security Manager generates the key if it does not already exist. If you change this value for an existing GET VPN, you need to synchronize keys from the Key Servers policy. For more detailed information about how this key is used, and the key generation and synchronization process, see <a href="#">Generating and Synchronizing RSA Keys, page 28-13</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Lifetime (KEK)       | <p>The number of seconds that the key encryption key (KEK) is valid. This key is used for encrypting rekey messages. Before the end of this lifetime, the key server sends rekey messages to the group, which includes a new KEK encryption key and transforms and new TEK encryption keys and transforms.</p> <p>The KEK lifetime value should be greater than the TEK lifetime value (it is recommended that the KEK lifetime value be at least three times greater than the TEK lifetime value). The default value of 86,400 seconds is usually appropriate. The TEK lifetime value is configured for each security association (see <a href="#">Add New or Edit Security Association Dialog Box, page 24-55</a>).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Encryption Algorithm | <p>The algorithm used to encrypt the rekey message from the key server to the group member.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Retransmits          | <p>The number of times the rekey message can be sent if one or more group members do not receive it.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Interval             | <p>The number of seconds between retries.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Table 24-12 GET VPN Group Encryption Policy Page (Continued)

| Element                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Security Associations Tab</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Security Associations table      | <p>Use the Security Associations table to define security associations for the VPN. The columns in the table summarize the settings for an entry and are explained in <a href="#">Add New or Edit Security Association Dialog Box, page 24-55</a>. When creating a new VPN, the Security Policy field (explained above) is used instead of this tab, which does not appear in the wizard.</p> <p>To configure security associations:</p> <ul style="list-style-type: none"> <li>• Click the <b>Add</b> button to add an entry to the table, and fill in the Add New Security Association dialog box.</li> <li>• Select an entry and click the <b>Edit</b> button to edit an existing entry.</li> <li>• Select an entry and click the <b>Delete</b> button to delete it.</li> </ul> |

**Add Certificate Filter Dialog Box**

Use the Add Certificate Filter dialog box to define a certificate filter for the group encryption policy for GET VPNs. This filter, located on the key server, specifies the attributes and values used to validate whether the group member is authorized to join the group.

Select one of the following filter types:

- **dn**—(Distinguished name.) Specify a comma separated list of *name=value* pairs in the **Subject** field. For example, OU=Cisco, C=US. When you configure the Public Key Infrastructure policy, the PKI enrollment object you select should define the same values on the Certificate Subject Name tab (see [PKI Enrollment Dialog Box—Certificate Subject Name Tab, page 25-61](#)). Using a distinguished name can let you match multiple devices with a single filter.
- **fqdn**—(Fully-qualified domain name.) Specify the fully qualified domain name of a single device (for example, router1.example.com) in the **Domain Name** field. When you configure the Public Key Infrastructure policy, the PKI enrollment object you select should have the **Include Device's FQDN** option selected. Because each device has a unique name, an FQDN filter matches a single device only.

**Tip**

To configure certificate authorization, you must also configure a Public Key Infrastructure (PKI) policy for the GET VPN. The PKI policy is configured on all devices in the VPN.

**Navigation Path**

From the Group Settings tab on the GET VPN Group Encryption page, select Certificates as the authorization type and click the **Add Row** button under the Authorization Filter table, or select a filter and click the **Edit Row** button. For information on opening the Group Encryption page, see [Defining GET VPN Group Encryption, page 24-51](#).

**Add New or Edit Security Association Dialog Box**

Use the Add New or Edit Security Association dialog boxes to define an IPSec profile (name and transform set only) and security policy used by the selected GET VPN topology.

**Navigation Path**

To open the Add New Security Association dialog box, from the Security Associations tab on the GET VPN Group Encryption page, click the **Add Row (+)** button or select an existing association and click the **Edit Row (pencil)** button. For information on opening the Group Encryption page, see [Defining GET VPN Group Encryption, page 24-51](#).

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ID                 | The sequence number of the profile. This number defines the relative priority of the security association (1 being the highest). If you have more than one security association, the ACLs for each are concatenated (and merged) in the order represented by this number, and the group members process the collected ACL as a single ACL.<br><br>Keep the default number or enter a new one. |
| IPSec Profile Name | The name of the IPSec profile.                                                                                                                                                                                                                                                                                                                                                                |
| Transform Sets     | The transform set policy objects (security protocols, algorithms, and other settings) defined for the IPSec profile. Separate multiple entries with commas, and place them in priority order. Click <b>Select</b> to choose from a list of predefined transform sets or to create a new one.                                                                                                  |

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Security Policy    | <p>The access control list policy object defined for the security association. Click <b>Select</b> to choose from a list of predefined ACL objects or to create a new one. For a detailed explanation of the contents of this object and how it relates to the group member security policy, see <a href="#">Understanding the GET VPN Security Policy and Security Associations</a>, page 28-10.</p> <p><b>Note</b> If you are using multicast as the method to distribute the keys, then the ACL policy object must contain a deny rule (ACE) for the multicast address. In this way, the rekey packets sent using multicast will not be encrypted by the TEK. This statement allows the group members to receive rekey packets sent using the multicast protocol.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Enable Anti-Replay | <p>Whether to enable the anti-replay feature, which helps prevent eavesdroppers from inserting packets into the data stream. You can configure anti-replay based on traffic counters or time:</p> <ul style="list-style-type: none"> <li>• <b>Counter Window Size</b>—Although this is the default, it is not recommended. Counter-based anti-replay is useful only if there are two group members (essentially a point-to-point VPN). Select a window size.</li> <li>• <b>Time Window Size</b>—This is the preferred method, but it requires that there are more than two group members. Enter the number of seconds of the interval duration of the Synchronous Anti-Replay (SAR) clock. The value range is 1 through 100. The default value is 100. For more information on time-based anti-replay, see <a href="#">Understanding Time-Based Anti-Replay</a>, page 28-11.</li> </ul> <p><b>Note</b> If you are encrypting high packet rates for count-based anti-replay, ensure that you do not make the KEK or TEK lifetime too long or it can take several hours for the sequence number to wrap. For example, if the packet rate is 100 kilopackets per second, the lifetime should be configured as less than 11.93 hours so that the SA is used before the sequence number wraps.</p> |

**Table 24-13** Add New Security Association Dialog Box (Continued)

| Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable IPsec Lifetime | <p>Whether to configure an IPsec security association lifetime that overrides the global setting, which is configured in the Global Settings for GET VPN policy (see <a href="#">Configuring Global Settings for GET VPN, page 28-16</a>). This lifetime value controls how long the traffic encryption key (TEK) can be used before a rekey is required.</p> <p>Configure a value based on the volume of traffic (in kilobytes) between group members, seconds, or both. The key expires when either of the values is reached. Use the following recommendations:</p> <ul style="list-style-type: none"> <li>• The lifetime should be significantly shorter than the one used for the key encryption key (KEK) (see <a href="#">Defining GET VPN Group Encryption, page 24-51</a>), perhaps a third of the length.</li> <li>• The timed lifetime is the recommended approach, because high traffic volumes can cause excessive rekeys (with potential data loss).</li> <li>• Leave a field blank to not override that global setting.</li> </ul> |

## Defining GET VPN Peers

Use the GET VPN Peers page of the Create VPN wizard to configure peer properties for the key servers and group members in a GET VPN topology. After creating the topology, use the **Key Servers** and **Group Members** policies to modify these settings. The policies are the same as the wizard page, except that the key server and group member tables are split into separate policies.

### Tip

The list of key servers and group members includes those devices you selected on the Device Selection page of the wizard (see [Selecting Devices for Your VPN Topology, page 24-32](#)), however, you can use the **Add (+)** and **Delete (trash can)** buttons to add or remove devices from this page.

Examine the list of key servers and group members to determine if the default settings are appropriate for your VPN. You can select **Matching Interfaces** from the **Show** field below each table to display the actual interfaces that will be selected by the default interface roles. The interface roles must resolve to actual interfaces on the device for the GET VPN configuration to be valid.

### Before You Begin

This procedure describes how to define peers for GET VPN when creating a new VPN, and explains just the GET VPN peers configuration. For information on opening the Create VPN wizard, see [Creating or Editing VPN Topologies, page 24-28](#).

### Related Topics

- [Configuring Fail-Close to Protect Registration Failures, page 28-8](#)
- [Using Passive Mode to Migrate to GET VPN, page 28-23](#)
- [Configuring GET VPN Key Servers, page 28-18](#)
- [Configuring GET VPN Group Members, page 28-20](#)

**Step 1** Configure the key servers if the default settings are not appropriate.

For each key server you want to modify, select it, click the **Edit (pencil)** button beneath the table, and configure at least following settings. For information on all available settings, see [Edit Key Server Dialog Box, page 28-19](#).

- **Identity Interface**—Select the interface that group members use to identify the key server and register with it. The default is the Loopback interface role, which identifies all Loopback interfaces defined on the key server.
- **Priority**—Define the role of the key server as primary or secondary by entering a priority value between 1-100. The key server with the highest priority becomes the primary key server. If two or more key servers are assigned the same priority value, the device with the highest IP address is used. The default priority is 100 for the first key server, 95 for the second, and so on.

**Note** There can be more than one primary key server if the network is partitioned.

**Step 2** Move key servers up or down in the table to specify the order that group members use to register with key servers. Group members register with the first key server in the list. If the first key server cannot be reached, they will register with the second key server, and so on. Note that this order does not define the overall key server priority, which is used to determine which key server is the primary key server.

**Step 3** Configure the group members if the default settings are not appropriate.

For each group member you want to modify, select it, click the **Edit (pencil)** button beneath the table, and configure at least the following settings:

- **GET-Enabled Interface**—This is the VPN-enabled outside interface to the provider edge (PE). Traffic originating or terminating on this interface is evaluated for encryption or decryption, as appropriate. You can configure multiple interfaces by selecting an interface role object that resolves to more than one interface. Click **Select** to select an interface role object or to create a new object.
- **Interface To Be Used As Local Address**—The interface whose IP address is used to identify the group member to the key server for sending data, such as rekey information. If GET is enabled on only one interface, you do not need to specify the interface to be used as the local address. If GET is enabled on more than one interface, you must specify the interface to be used as the local address. Enter the name of the interface or interface role, or click **Select** to select an interface role.

For information on the other available settings, see [Edit Group Member Dialog Box, page 28-21](#).

## Assigning Initial Policies (Defaults) to a New VPN Topology

Use the VPN Defaults page of the Create VPN wizard to view and select the shared site-to-site VPN policies that will be assigned to the VPN topology you are creating. The page displays all the available mandatory and optional policies that can be assigned to your VPN topology, according to the selected IPsec technology. (For more information, see [Understanding Mandatory and Optional Policies for Site-to-Site VPNs, page 24-6](#).)

For information on opening the Create VPN wizard, see [Creating or Editing VPN Topologies, page 24-28](#). After you create the topology, you edit these policies directly.

For each policy type, select the shared VPN policy you want to assign to your VPN topology. Only shared policies are available for selection. Use the following tips to guide your selection:

- The initial defaults listed in this page are configured in the Security Manager Administration [VPN Policy Defaults Page, page 11-53](#). If no specific default was configured for a mandatory policy, the Factory Default policy is selected. For more information about configuring default policies, see [Understanding and Configuring VPN Default Policies, page 24-12](#).
- The shared policies listed are only those that have been committed to the database. For example, if you create a new shared IPsec Proposal policy before using the Create VPN wizard, but you do not submit (and have approved, if necessary) the policy beforehand, the new policy does not appear in the list. Ensure that you submit policies before creating a VPN if you need to use the new policies.
- If a policy is mandatory, you must make a selection. If there are no shared policies, Factory Default is your only option. You can always edit the policy after you create the topology.

**Note** If you try to select a shared policy that is currently locked by another user, a message is displayed warning you of a lock problem. To bypass the lock, select a different policy or cancel the VPN topology creation until the lock is removed. For more information, see [Understanding Policy Locking, page 5-7](#).

- If a policy is optional, and there are no shared policies, you cannot select anything. If you want the features provided by that policy, configure it after you finish creating the topology.
- To view the contents of the policy in a read-only dialog box, select the policy and click the **View Contents** button beside the policy list.
- If you are creating a topology that supports IKEv2 only, the Create VPN wizard will still create either an IKEv1 Preshared Key or IKEv1 Public Key Infrastructure policy according to your selection. There are no default configurations for IKEv2 Authentication policies. Whenever you choose to support IKEv2, you must manually edit the IKEv2 Authentication policy after creating the VPN to define at least the global IKEv2 settings. You can also create peer-specific IKEv2 overrides. When supporting IKEv2 only, you can unassign the IKEv1-specific policies created by the wizard.

When you are done, click **Finish** to create the new VPN topology. The new VPN topology appears in the VPNs selector in the Site-to-Site VPN window, with the VPN Summary page displayed. See [Viewing a Summary of a VPN Topology's Configuration, page 24-59](#).

## Viewing a Summary of a VPN Topology's Configuration

Use the VPN Summary page to view a summary of the configuration of a selected VPN topology. This includes information about the type of VPN topology, its devices, the assigned technology, and specific policies that are configured in it. The summary page is opened automatically after you create a VPN topology. When creating an Extranet VPN, it is also shown as the final step of the Create Extranet VPN wizard.

To open the VPN Summary page for a VPN topology:

- ([Site-to-Site VPN Manager Window, page 24-18](#)) Select the VPN topology, then select **VPN Summary** from the Policies list.
- (Device view) Select a device that participates in the VPN and select the **Site-to-Site VPN** policy from the Policies list. Select the VPN topology, then click the **Edit VPN Policies** button. This opens the Site-to-Site VPN Manager window with the topology selected, where you can select **VPN Summary** from the Policies list.

The following table describes the information shown on this page.

**Note**

The summary for standard VPNs is significantly different from the summary for Extranet VPNs. This table is divided in two, with the top half explaining summaries for standard VPNs, and the bottom half explaining summaries for Extranet VPNs.

**Table 24-14** VPN Summary Page

| Element                                      | Description                                                                                                                                                                                                      |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Summary Information for Standard VPNs</b> |                                                                                                                                                                                                                  |
| Name                                         | The name of the VPN topology.                                                                                                                                                                                    |

| Peer 1                                       | Available if the VPN topology type is point-to-point.<br>The name of the device that is defined as Peer One in the point-to-point VPN topology.                                                                  |
| Peer 2                                       | Available if the VPN topology type is point-to-point.<br>The name of the device that is defined as Peer Two in the point-to-point VPN topology.                                                                  |
| Number of Peers                              | Available if the VPN topology type is full mesh.<br>The number of devices included in the full mesh VPN topology.                                                                                                |
| IKE Proposal                                 | The security parameters of the IKEv1 proposal configured in the VPN topology. See <a href="#">Configuring an IKE Proposal, page 25-9</a> .<br><b>Note</b> IKEv2 proposals are not displayed in the summary.      |
| Dynamic VTI                                  | Available in an Easy VPN topology.<br>Displays if a dynamic virtual template interface is configured on a device in an Easy VPN topology. See <a href="#">Configuring Dynamic VTI for Easy VPN, page 27-12</a> . |

Table 24-14 VPN Summary Page (Continued)

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Transform Sets            | <p>The IPsec IKEv1 transform sets that specify the authentication and encryption algorithms that will be used to secure the traffic in the VPN tunnel. See <a href="#">Configuring IPsec Proposals in Site-to-Site VPNs, page 25-21</a>.</p> <p><b>Note</b> IPsec IKEv2 transform sets are not displayed in the summary.</p>                                                                                                                                                                                                                                                                                    |
| Preshared Key             | <p>Unavailable if the selected technology is Easy VPN.</p> <p>Specifies whether the shared key to use in the IKEv1 preshared key policy is user defined or auto-generated. See <a href="#">Configuring IKEv1 Preshared Key Policies, page 25-44</a>.</p> <p><b>Note</b> IKEv2 preshared key settings are not displayed in the summary.</p>                                                                                                                                                                                                                                                                      |
| Public Key Infrastructure | <p>If an IKEv1 Public Key Infrastructure policy is configured in the VPN topology, specifies the certificate authority (CA) server. See <a href="#">Configuring IKEv1 Public Key Infrastructure Policies in Site-to-Site VPNs, page 25-50</a>.</p> <p><b>Note</b> IKEv2 PKI configurations are not displayed in the summary.</p>                                                                                                                                                                                                                                                                                |
| Routing Protocol          | <p>Available only if the selected technology is IPsec/GRE, GRE Dynamic IP, or DMVPN.</p> <p>The routing protocol and autonomous system (or process ID) number used in the secured IGP for configuring a GRE, GRE Dynamic IP, or DMVPN routing policy.</p> <p><b>Note</b> Security Manager adds a routing protocol to all the devices in the secured IGP on deployment. If you want to maintain this secured IGP, you must create a router platform policy using this routing protocol and autonomous system (or process ID) number.</p> <p>See <a href="#">Understanding the GRE Modes Page, page 26-1</a>.</p> |
| Tunnel Subnet IP          | <p>Available only if the selected technology is IPsec/GRE, GRE Dynamic IP, or DMVPN.</p> <p>If a tunnel subnet is defined, displays the inside tunnel interface IP address, including the unique subnet mask.</p> <p>See <a href="#">Understanding the GRE Modes Page, page 26-1</a>.</p>                                                                                                                                                                                                                                                                                                                       |
| User Group                | <p>Available for an Easy VPN topology.</p> <p>If a User Group policy is configured on a device in the Easy VPN topology, displays the details of the policy. See <a href="#">Configuring a User Group Policy for Easy VPN, page 27-14</a>.</p>                                                                                                                                                                                                                                                                                                                                                                  |
| PIX7.0/ASA Tunnel Group   | <p>Available for an Easy VPN topology.</p> <p>If a Connection Profile policy is configured on a PIX Firewall version 7.0+ or ASA appliance in the Easy VPN topology, displays the details of the policy. See <a href="#">Connection Profiles Page, page 30-8</a>.</p>                                                                                                                                                                                                                                                                                                                                           |

Table 24-14 VPN Summary Page (Continued)

| Element                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| High Availability                            | Available if the VPN topology type is hub-and-spoke.<br>If a High Availability policy is configured on a device in your hub-and-spoke VPN topology, displays the details of the policy. See <a href="#">Configuring High Availability in Your VPN Topology, page 24-49</a> .                                                                                                                                                                                                                                                                                                                       |
| VRF-Aware IPsec                              | Available if the VPN topology type is hub-and-spoke.<br>If a VRF-Aware IPsec policy is configured on a hub in your hub-and-spoke VPN topology, displays the type of VRF solution (1-Box or 2-Box) and the name of the VRF policy. See <a href="#">Configuring VRF Aware IPsec Settings, page 24-46</a> .                                                                                                                                                                                                                                                                                           |
| <b>Summary Information for Extranet VPNs</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| IKE Phase 1 Proposal section                 | The parameters for the IKE Phase 1 proposal, which are defined in the IKE Proposal policy object that is assigned to the Extranet. For information about the settings, see the following topics: <ul style="list-style-type: none"> <li>• <a href="#">Configuring IKEv1 Proposal Policy Objects, page 25-10</a></li> <li>• <a href="#">Configuring IKEv2 Proposal Policy Objects, page 25-13</a></li> </ul>                                                                                                                                                                                        |
| IKE Phase 2 Proposal section                 | The parameters of the IKE Phase 2 proposal. Most of these parameters are configured in the IPsec transform set policy object assigned to the Extranet. For explanations, see <a href="#">Configuring IPsec IKEv1 or IKEv2 Transform Set Policy Objects, page 25-25</a> .<br><br>The Lifetime attribute parameter is defined in the VPN Global Settings policy, see <a href="#">Configuring VPN Global Settings, page 25-29</a> . The Perfect Forward Secrecy parameter is defined in the IPsec Proposal policy, see <a href="#">Configuring IPsec Proposals in Site-to-Site VPNs, page 25-21</a> . |
| Authentication section                       | The preshared key or the PKI enrollment policy object that defines the certificate used to authenticate the connection.<br><br>When using preshared keys, you can click the <b>Show/Hide Key</b> button to toggle between showing and masking the key. If you print the summary or generate a PDF, the key is shown or hidden based on your selection here.                                                                                                                                                                                                                                        |
| Local                                        | The device at the local (managed) end of the Extranet VPN, including the display name, VPN interface name and IP address, and the protected networks.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Remote                                       | The device at the remote (unmanaged) end of the Extranet VPN, including the device name, the IP address of the VPN interface, and the protected networks.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Print button                                 | Click this button to print the summary. The preshared key is shown or hidden based on what is currently displayed in the page.<br><br>To print the summary, you must have Adobe Acrobat Reader installed. Security Manager generates a PDF of the summary and then prints it using Acrobat's printing capability.                                                                                                                                                                                                                                                                                  |
| Generate PDF button                          | Click this button to create a PDF of the summary. The preshared key is shown or hidden based on what is currently displayed in the page. You are prompted for a file name and a location to save the PDF.                                                                                                                                                                                                                                                                                                                                                                                          |

## Creating or Editing Extranet VPNs

Security Manager provides a simplified method of creating a regular IPsec point-to-point VPN between a device that you are managing in Security Manager and one that is not managed. This type of VPN is called an *Extranet*.

Typically, an Extranet is a site-to-site VPN connection between your network and the network of a partner or a service provider. However, it can also be a VPN connection within your organization's network, but between devices managed by different groups, or between a Cisco device and a non-Cisco device (which Security Manager cannot manage).

Use the Create Extranet VPN wizard to create this type of point-to-point VPN topology. Creating an Extranet VPN involves specifying the devices, the VPN interfaces that are the source and destination endpoints of the VPN tunnel, and the protected networks that will be secured by the tunnel. You also specify the IKE and IPsec proposals and preshared key or certificates required to complete a secure connection.

When you edit an Extranet VPN topology, the Edit Extranet VPN dialog box contains the same pages as the Create Extranet VPN wizard, with the exception of the IKE proposal page, but the pages are laid out in a tabbed format rather than being presented as a wizard. Clicking **OK** on any tab in the dialog box saves your definitions on all the tabs. For IKE proposals, IPsec proposals, preshared keys, and Public Key Infrastructure certificates, you must edit the policies directly.

**Tips**

- VPN default policies do not apply to Extranet VPNs. The settings defined on the Security Manager Administration VPN Defaults page are ignored. If you have shared policies that you want to use in the Extranet VPN configuration, you can assign them to the VPN after you create it with the Create Extranet VPN wizard. Assigning the shared policy replaces the policy created by the wizard.
- You cannot select your pre-defined IKE proposal or IPsec transform set policy objects when creating an Extranet VPN. If you have existing objects that you want to use, you can edit the relevant policies after creating the VPN and select the objects. You can then delete the objects created by the Create Extranet VPN wizard, if desired.
- After creating an Extranet VPN, you cannot convert it to a standard point-to-point VPN, where you are managing both ends of the VPN in Security Manager. Instead, you must delete and recreate the VPN.

- You can configure Extranet VPN connections for regular IPsec point-to-point connections only. For example, you cannot use this method to identify a GET VPN key server that exists in your service provider's network. To configure all other types of Extranet connections, you must add dummy unmanaged devices to the Security Manager inventory as described in [Including Unmanaged or Non-Cisco Devices in a VPN, page 24-11](#).

#### Related Topics

- [Understanding VPN Topologies, page 24-2](#)
- [Configuring VPN Topologies in Device View, page 24-19](#)
- [Understanding IPsec Technologies and Policies, page 24-5](#)
- [Using Wizards, page 1-44](#)

---

#### Step 1 Do one of the following

- To create a new Extranet VPN, in the [Site-to-Site VPN Manager Window](#) or the Site-to-Site VPN policy page (Device View), click the **Create VPN Topology (+)** button and select **Extranet VPN**. The Create Extranet VPN wizard starts with the Name and Technology page.
- To edit an existing Extranet VPN, select the VPN topology in the Site-to-Site VPN Manager window or the Site-to-Site VPN policy page (Device View) and click the **Edit VPN Topology (pencil)** button. The Edit Extranet VPN dialog box opens to the Device Selection tab.

#### Step 2 On the Name and Technology page or tab, configure the following; only the name is required:

- **Name**—A unique name that identifies the VPN topology.
- **Description**—A description of the VPN, up to 1024 characters.
- **Creation Date**—The date on which the VPN was created. When creating the VPN, today's date is the default. However, you can click the calendar icon beside the edit box and select the desired date.
- **Ticket Number**—If you use a trouble ticket system, and the action you are taking relates to a tracked requirement, enter the number in this field. Security Manager does not use this number; it is for your internal tracking purposes only.
- **Last Modified By**—The name, user ID, email address, or other indicator of the person who last changed the settings for the VPN. Security Manager does not use this field; it is for your internal tracking purposes only.

In the wizard, click **Next**; in the Edit Extranet VPN dialog box, click the **Device Selection** tab.

#### Step 3 On the Device Selection page or tab, configure the devices, interfaces, and protected networks for each end of the connection:

- **Local**—This is the device in your managed network. The device must be in the Security Manager inventory. Configure all of these properties:
  - **Device**—Enter the display name of the device or click **Select** to select it from the list of devices in the inventory. You can select ASA 5500 series devices, PIX firewalls, or Cisco IOS routers (including ASRs).
  - **VPN Tunnel Interface**—The name of the interface or interface role that identifies the external interface for the VPN connection. Click **Select** to select an existing interface or interface role, or to create a new interface role.

When you select an interface or role, the IP address for the matching interface appears next to the IP Address display field. If no address appears, Security Manager could not determine the IP address. Check your configuration or object selection.

- **Protected Networks**—The networks that the device is protecting for this VPN. Click **Select** to display the Protected Network Selection dialog box in which you can specify the protected networks using an interface name, interface role object, network/host group object, or ACL object. You can also use the Protected Network Selection dialog box to define new network/host group or ACL objects.

**Note** You can also edit the local device endpoint settings as described in [Defining the Endpoints and Protected Networks, page 24-33](#). The settings are similar to these, with the added ability to define interface role objects.

- **Remote**—This is the device that you are not managing in Security Manager. Configure all of these properties:
  - **Name**—The name of the device, equivalent to the display name used in the Security Manager inventory.
  - **IP Address**—The IP address of the VPN interface on the device.
  - **Protected Networks**—The networks that the device is protecting for this VPN. Click **Select** to display the Protected Network Selection dialog box in which you can specify the protected networks using a network/host group object or ACL object. You can also use the Protected Network Selection dialog box to define new network/host group or ACL objects.

**Note** You can also edit the remote device endpoint settings as described in [Defining the Endpoints and Protected Networks, page 24-33](#). However, the settings are identical to these, and you cannot specify the protected networks using an interface name or interface role object.

In the wizard, click **Next**. In the Edit VPN dialog box, you are finished; to edit the remaining characteristics, you must edit the IKE Proposal, IPsec Proposal, IKEv1 Preshared Key, IKEv1 Public Key Infrastructure, IKEv2 Authentication, and VPN Global Settings policies to change the settings described in the next step.

**Step 4** On the IKE Proposal page of the Create Extranet VPN wizard, define the IKE proposal, the IPsec proposal, and either the preshared key or the certificate:

- Select **IKEv1** or **IKEv2**. You can use IKEv2 on ASA 5500 series devices running release 8.4(x) only.

If you want to change IKE versions after creating the Extranet VPN, you must edit all of these policies to unassign or replace the old configuration while configuring options for the desired version: IKE Proposal, IPsec Proposal, IKEv1 Preshared Key, IKEv1 Public Key Infrastructure, IKEv2 Authentication, VPN Global Settings. For information on how IKEv1 and IKEv2 differ, see [Comparing IKE Version 1 and 2, page 25-4](#).

- Configure the IKE Phase 1 Proposal parameters. These parameters will be used to create an IKE proposal policy object with the name *ExtranetName\_ikeBB*. For an explanation of the parameters, see [Configuring IKEv1 Proposal Policy Objects, page 25-10](#) or [Configuring IKEv2 Proposal Policy Objects, page 25-13](#).

To edit these values after creating the VPN, you simply need to edit the object. You can edit the object in the Policy Object Manager or directly through the IKE Proposal policy for the VPN.

**Note** The **DH Group** attribute (for Diffie-Hellman modulus group) is called **Modulus Group** in other policies and policy objects.

- Configure the IKE Phase 2 (IPsec) Proposal parameters. Most of these parameters will be used to create an IPsec transform set policy object with the name *ExtranetName\_transformSet*. For an explanation of the parameters, see [Configuring IPsec IKEv1 or IKEv2 Transform Set Policy Objects, page 25-25](#). Note that the AH Hash Algorithm setting is available only if the local device is a router.

To edit these values after creating the VPN, you simply need to edit the object. You can edit the object in the Policy Object Manager or directly through the IPsec Proposal policy for the VPN.

The following settings are not part of the IPsec transform set object:

- **Enable Perfect Forward Secrecy, DH Group**—Whether to use a unique session key for each encrypted exchange, which prevents an attacker from decrypting a captured exchange even if the attacker knows the preshared or private keys used by both ends of the tunnel. If you select this option, also select the Diffie-Hellman (DH) modulus group to use for deriving the key. For more information on the modulus group, see [Deciding Which Diffie-Hellman Modulus Group to Use, page 25-7](#).

To change this option after creating the VPN, edit the IPsec Proposal policy.

- **Lifetime**—The number of seconds a security association will exist before expiring. The default is 3,600 seconds (one hour).

To change this option after creating the VPN, edit the VPN Global Settings policy.

- If you select **Preshared Key** for authentication, enter the key used to authenticate connections with the remote host.

To edit the key after creating the VPN, you must edit either the IKEv1 Preshared Key or IKEv2 Authentication policy depending on the IKE version you are using. The key is masked in these policies, but you can display the key by selecting the VPN Summary policy and clicking the Show Key button beside the preshared key.

- If you select **Certificate**, select the PKI enrollment object that defines the certificate name. If the required object is not yet defined, select **<Add New>** to open the Add PKI selector, from which you can add new, or edit existing, PKI enrollment objects. For more information about PKI enrollment objects, see [PKI Enrollment Dialog Box, page 25-54](#).

To edit the certificate settings after creating the VPN, you can edit the object in the Policy Object Manager or directly through either the IKEv1 Public Key Infrastructure or IKEv2 Authentication policy depending on the IKE version you are using.

In the wizard, click **Next**.

- Step 5** (Create Extranet VPN wizard only.) On the Summary page, verify that the settings are correct and click **Finish**.

Security Manager creates the topology and the required policy objects, and adds the VPN to the list of VPNs in the Site-to-Site VPN Manager.

- Step 6** If you want to configure dial backup, select the **Peers** policy and follow the instructions in [Configuring Dial Backup, page 24-39](#).

## Deleting a VPN Topology

Deleting a VPN topology removes IPsec tunnels between peers and all configurations associated with the VPN topology from the devices and networks assigned to the site-to-site VPN. The actual VPN is not removed from the network until you deploy configurations.

- 
- Step 1** Do one of the following:
- Select **Manage > Site-To-Site VPNs** to open the [Site-to-Site VPN Manager Window, page 24-18](#).
  - In Device view, select a device that participates in the VPN you want to delete, then select the **Site to Site VPN** policy from the policy selector (see [Configuring VPN Topologies in Device View, page 24-19](#)).
- Step 2** Select the VPN topology you want to delete and click the **Delete VPN Topology (trash can)** button. You are asked to confirm the deletion.
-

## CHAPTER 25

# Configuring IKE and IPsec Policies

---

This chapter describes how to configure Internet Protocol Security (IPsec) and the Internet Security Association and Key Management Protocol (ISAKMP, or IKE) standards to build site-to-site and remote access IPsec Virtual Private Networks (VPNs). These policies are used in regular IPsec and other types of IPsec-based VPN technologies to build VPN tunnels.

Tunneling makes it possible to use a public TCP/IP network, such as the Internet, to create secure connections between remote users and a private corporate network. Each secure connection is called a tunnel.

IPsec-based VPN technologies use the ISAKMP and IPsec tunneling standards to build and manage tunnels. ISAKMP and IPsec accomplish the following:

- Negotiate tunnel parameters.
- Establish tunnels.
- Authenticate users and data.
- Manage security keys.
- Encrypt and decrypt data.
- Manage data transfer across the tunnel.
- Manage data transfer inbound and outbound as a tunnel endpoint or router.

A device in a VPN functions as a bidirectional tunnel endpoint. It can receive plain packets from the private network, encapsulate them, create a tunnel, and send them to the other end of the tunnel where they are unencapsulated and sent to their final destination. It can also receive encapsulated packets from the public network, unencapsulate them, and send them to their final destination on the private network.

The following topics explain the basic IKE and IPsec policies and how to configure them:

- [Overview of IKE and IPsec Configurations, page 25-2](#)
- [Understanding IKE, page 25-5](#)
- [Understanding IPsec Proposals, page 25-17](#)
- [Configuring VPN Global Settings, page 25-29](#)
- [Understanding IKEv1 Preshared Key Policies in Site-to-Site VPNs, page 25-43](#)
- [Understanding Public Key Infrastructure Policies, page 25-47](#)
- [Configuring IKEv2 Authentication in Site-to-Site VPNs, page 25-62](#)

# Overview of IKE and IPsec Configurations

Internet Key Exchange (IKE) is a key management protocol that is used to authenticate IPsec peers, negotiate and distribute IPsec encryption keys, and to automatically establish IPsec security associations (SAs).

The IKE negotiation comprises two phases. Phase 1 negotiates a security association between two IKE peers, which enables the peers to communicate securely in Phase 2. During Phase 2 negotiation, IKE establishes SAs for other applications, such as IPsec. Both phases use proposals when they negotiate a connection.

An IKE proposal is a set of algorithms that two peers use to secure the IKE negotiation between them. IKE negotiation begins by each peer agreeing on a common (shared) IKE policy. This policy states which security parameters will be used to protect subsequent IKE negotiations. For IKE version 1 (IKEv1), IKE proposals contain a single set of algorithms and a modulus group. You can create multiple, prioritized policies at each peer to ensure that at least one policy matches a remote peer's policy. Unlike IKEv1, in an IKEv2 proposal, you can select multiple algorithms and modulus groups from which peers can choose during the Phase 1 negotiation, potentially making it possible to create a single IKE proposal (although you might want different proposals to give higher priority to your most desired options). You can define several IKE proposals per VPN.

You must configure several policies to define the settings required to make successful regular IPsec connections in a site-to-site or remote access VPN. The following procedure provides an overview of the steps required to complete the configuration, and points to other topics that provide detailed information for each step.

## Related Topics

- [Understanding IKE, page 25-5](#)
- [Understanding IPsec Proposals, page 25-17](#)
- [Understanding IKEv1 Preshared Key Policies in Site-to-Site VPNs, page 25-43](#)
- [Understanding Public Key Infrastructure Policies, page 25-47](#)

---

### Step 1 Configure the **IKE Proposal** policy.

In the IKE Proposal policy, you define the IKE proposal policy objects to use for making VPN connections. When defining the IKE proposal object, you select the algorithms to use for encrypting the IKE negotiation and for integrity checking, and the Diffie-Hellman group to use to operate the encryption algorithm. For IKEv1, you also determine whether you are using preshared keys or Public Key Infrastructure, whereas in IKEv2, the IKE proposal does not include a specification for authentication mode.

The following topics explain how to configure the IKE Proposal policy:

- [Configuring an IKE Proposal, page 25-9](#)
  - [Configuring IKEv1 Proposal Policy Objects, page 25-10](#)
  - [Configuring IKEv2 Proposal Policy Objects, page 25-13](#)
- [Configuring the IKE Proposal for GET VPN, page 28-15](#)

### Step 2 Complete the authentication mode configuration.

Your selection for authentication mode in the IKEv1 proposal, and your decision on which mode to use for IKEv2, controls what other policies are required to complete the authentication mode configuration:

- Preshared keys—For remote access IKEv1 IPsec VPNs, you define the preshared keys in the **Connection Profiles** policy; preshared keys are not supported for IKEv2 in remote access VPNs. For site-to-site VPNs, you define the keys in the **IKEv1 Preshared Keys** or the **IKEv2 Authentication** policy based on the IKE version you are using.

The following topics explain preshared key configuration:

- [IPSec Tab \(Connection Profiles\), page 30-16](#)
  - [Configuring IKEv1 Preshared Key Policies, page 25-44](#)
  - [Configuring IKEv2 Authentication in Site-to-Site VPNs, page 25-62](#)
- Public Key Infrastructure Certificate Authority servers—If you configure IKE to use Certificate Authority (CA) servers, you must configure the **Public Key Infrastructure** policy. You also use this policy to define the Public Key Infrastructure for SSL VPNs. For site-to-site VPNs, the policy is **IKEv1 Public Key Infrastructure** or **IKEv2 Authentication**, based on the IKE version you are using.

The Public Key Infrastructure policy identifies the PKI enrollment object that identifies the Certificate Authority server. For site-to-site VPNs, you can select a single PKI enrollment object; for remote access VPNs, you can select all objects needed for your remote access connections. These trustpoints are then identified in the remote access **Connection Profiles** policy (on the IPsec tab).

The following topics explain public key infrastructure configuration:

- [Understanding Public Key Infrastructure Policies, page 25-47](#)
- [Configuring IKEv1 Public Key Infrastructure Policies in Site-to-Site VPNs, page 25-50](#)
- [Defining Multiple IKEv1 CA Servers for Site-to-Site VPNs, page 25-51](#)
- [Configuring Public Key Infrastructure Policies for Remote Access VPNs, page 25-52](#)
- [IPSec Tab \(Connection Profiles\), page 30-16](#)
- [Configuring IKEv2 Authentication in Site-to-Site VPNs, page 25-62](#)

- Step 3** Configure the **IPsec Proposal** policy. The IPsec Proposal policy defines the IPsec transform set policy objects used to create a secure IPsec tunnel for the VPN.

The following topics explain how to configure the IPsec Proposal policy:

- [Configuring IPsec Proposals in Site-to-Site VPNs, page 25-21](#)
  - [Selecting the IKE Version for Devices in Site-to-Site VPNs, page 25-25](#)
  - [Configuring IPsec IKEv1 or IKEv2 Transform Set Policy Objects, page 25-25](#)
- [Configuring an IPsec Proposal for Easy VPN, page 27-10](#)
- [Configuring an IPsec Proposal on a Remote Access VPN Server \(ASA, PIX 7.0+ Devices\), page 30-33](#)
- [Configuring an IPsec Proposal on a Remote Access VPN Server \(IOS, PIX 6.3 Devices\), page 32-3](#)

- Step 4** Configure the **Global Settings** policy.

The **Global Settings** (remote access) and **VPN Global Settings** (site-to-site) policies define various ISAKMP, IKEv1, IKEv2, IPsec, NAT, fragmentation, and other settings. These settings have default values that are frequently adequate, so normally you need to configure the Global Settings policy only if you want non-default behavior. However, you must configure the policy for remote access IKEv2 IPsec VPNs, because you must specify a remote access global trustpoint on the **IKEv2 Settings** tab.

The following topics explain how to configure the Global Settings policy:

- [Configuring VPN Global Settings, page 25-29](#)

- [Configuring VPN Global ISAKMP/IPsec Settings, page 25-30](#)
- [Configuring VPN Global IKEv2 Settings, page 25-34](#)
- [Configuring VPN Global NAT Settings, page 25-38](#)
- [Configuring VPN Global General Settings, page 25-40](#)
- [Configuring Global Settings for GET VPN, page 28-16](#)

**Step 5** If you are configuring a remote access IKEv2 IPsec VPN, you must also configure several policies for SSL VPN. IKEv2 shares several configuration settings with SSL VPNs. For information on the other policies you need to configure, see [Creating IPsec VPNs Using the Remote Access VPN Configuration Wizard \(ASA and PIX 7.0+ Devices\), page 29-24](#).

## Comparing IKE Version 1 and 2

There are two versions of IKE: version 1 (IKEv1) and version 2 (IKEv2). When you configure IKE on a device that supports IKEv2, you have the option of configuring either version alone, or both versions together. When the device attempts to negotiate a connection with another peer, it uses whichever versions you allow and that the other peer accepts. If you allow both versions, the device automatically falls back to the other version if negotiations are unsuccessful with the initially chosen version (IKEv2 is always tried first if it is configured). Both peers must support IKEv2 to use it in a negotiation.

**Tip**

Security Manager supports IKEv2 on ASA 8.4(1)+ only. For remote access IPsec VPNs, users must use the AnyConnect 3.0+ client to complete IKEv2 connections, and IKEv2 connections use the same license pool that is used for SSL VPN connections. The legacy VPN Client is used for IKEv1 remote access connections on ASAs. For more information about device support in VPNs, see [Understanding Devices Supported by Each IPsec Technology, page 24-9](#).

IKEv2 differs from IKEv1 in the following ways:

- IKEv2 fixes the Photuris style cookie mechanism.
- IKEv2 has fewer round trips in a negotiation than IKEv1, two round trips versus five for IKEv1 for a basic exchange.
- Transform options are OR'ed, which means that you can specify multiple options in a single proposal rather than creating separate unique proposals for each allowed combination.
- Built-in dead peer detection (DPD).
- Built-in configuration payload and user authentication mode.
- Built-in NAT traversal (NAT-T). IKEv2 uses ports 500 and 4500 for NAT-T.
- Improved re-keying and collision handling.
- A single security association (SA) can protect multiple subnets, which improves scalability.
- Asymmetric authentication in site-to-site VPNs, where each side of a tunnel can have different preshared keys, different certificates, or one side a key and the other side a certificate.
- For remote access IPsec VPNs, you can configure double authentication for IKEv2 connections in the same way that you configure them for remote access SSL VPNs. IKEv1 does not support double authentication.

**Related Topics**

- [Overview of IKE and IPsec Configurations, page 25-2](#)
- [Configuring an IKE Proposal, page 25-9](#)

## Understanding IKE

Internet Key Exchange (IKE), also called Internet Security Association and Key Management Protocol (ISAKMP), is the negotiation protocol that lets two hosts agree on how to build an IPsec security association (SA). It provides a common framework for agreeing on the format of SA attributes. This includes negotiating with the peer about the SA, and modifying or deleting the SA. IKE creates the cryptographic keys used to authenticate IPsec peers, negotiates and distributes IPsec encryption keys, and automatically establishes IPsec security associations.

The IKE negotiation comprises two phases. Phase 1 negotiates a security association between two IKE peers, creating the first tunnel that enables the peers to communicate securely in Phase 2, protecting later ISAKMP negotiation messages. During Phase 2 negotiation, IKE establishes SAs for other applications, such as IPsec, which protects the data sent between peers. Both phases use proposals when they negotiate a connection.

An IKE proposal is a set of algorithms that two peers use to secure the IKE negotiation between them. IKE negotiation begins by each peer agreeing on a common (shared) IKE policy. This policy states which security parameters will be used to protect subsequent IKE negotiations. In remote access IPsec VPNs, you can define several IKE proposals per VPN to create multiple, prioritized policies at each peer to ensure that at least one policy matches a remote peer's policy. For site-to-site VPNs, you can create a single IKE proposal.

To define an IKE proposal, you must specify:

- A unique priority (1 through 65,543, with 1 the highest priority).
- An encryption method for the IKE negotiation, to protect the data and ensure privacy. See [Deciding Which Encryption Algorithm to Use, page 25-6](#).
- A Hashed Message Authentication Codes (HMAC) method (called *integrity algorithm* in IKEv2) to ensure the identity of the sender, and to ensure that the message has not been modified in transit. See [Deciding Which Hash Algorithm to Use, page 25-6](#).
- For IKEv2, a separate pseudo-random function (PRF) used as the algorithm to derive keying material and hashing operations required for the IKEv2 tunnel encryption. The options are the same as those used for the hash algorithm; see [Deciding Which Hash Algorithm to Use, page 25-6](#).
- A Diffie-Hellman group to determine the strength of the encryption-key-determination algorithm. The device uses this algorithm to derive the encryption and hash keys. See [Deciding Which Diffie-Hellman Modulus Group to Use, page 25-7](#).
- An authentication method, to ensure the identity of the peers. See [Deciding Which Authentication Method to Use, page 25-8](#).
- A limit to the time the device uses an encryption key before replacing it.

**Tip**

(ASA devices only.) With IKEv1 policies, for each parameter, you set one value. For IKEv2, you can configure multiple encryption, integrity, PRF, and Diffie-Hellman options. The ASA orders the settings from the most secure to the least secure and negotiates with the peer using that order. This allows you to potentially send a single proposal to convey all the allowed transforms instead of the need to send each allowed combination as with IKEv1.

When IKE negotiation begins, the peer that initiates the negotiation sends all of its policies to the remote peer, and the remote peer searches for a match with its own policies, in priority order.

A match between IKE policies exists if they have the same encryption, hash (integrity and PRF for IKEv2), authentication, and Diffie-Hellman values, and an SA lifetime less than or equal to the lifetime in the policy sent. If the lifetimes are not identical, the shorter lifetime—from the remote peer policy—applies. If no match exists, IKE refuses negotiation and the IKE SA is not established.

The following topics explain how to configure IKE proposals:

- [Configuring an IKE Proposal, page 25-9](#)
- [Configuring IKEv1 Proposal Policy Objects, page 25-10](#)
- [Configuring IKEv2 Proposal Policy Objects, page 25-13](#)
- [Configuring the IKE Proposal for GET VPN, page 28-15](#)

## Deciding Which Encryption Algorithm to Use

When deciding which encryption and hash algorithms to use for the IKE proposal, your choice is limited to algorithms that are supported by the devices in the VPN.

You can choose from the following encryption algorithms:

- DES (Data Encryption Standard) is a symmetric secret-key block algorithm. It is faster than 3DES and uses less system resources, but it is also less secure. If you do not need strong data confidentiality, and if system resources or speed is a concern, you should choose DES.
- 3DES (Triple DES) is more secure because it processes each block of data three times, each time with a different key. However, it uses more system resources and is slower than DES. 3DES is the recommended encryption algorithm, assuming that the devices support it.
- AES (Advanced Encryption Standard) provides greater security than DES and is computationally more efficient than 3DES. AES offers three different key strengths: 128-, 192- and 256-bit keys. A longer key provides higher security but a reduction in performance. When you configure IKE on a router, the router must use Cisco IOS Software 12.3T or later to use AES.

---

**Note** AES cannot be used in conjunction with a hardware encryption card.

## Deciding Which Hash Algorithm to Use

You can choose from the following hash algorithms. In IKEv2, the hash algorithm is separated into two options, one for the integrity algorithm, and one for the pseudo-random function (PRF).

- SHA (Secure Hash Algorithm) is more resistant to brute-force attacks than MD5. However, it is also more resource intensive than MD5. For implementations that require the highest level of security, use the SHA hash algorithm.

Standard SHA produces a 160-bit digest.

The following options, which are even more secure, are available for IKEv2 configurations on ASA 8.4(2+) devices:

- SHA512—A 512-bit key.
  - SHA384—A 384-bit key.
  - SHA256—A 256-bit key.
- MD5 (Message Digest 5) produces a 128-bit digest and uses less processing time for an overall faster performance than SHA, but it is considered to be weaker than SHA.

## Deciding Which Diffie-Hellman Modulus Group to Use

Security Manager supports the following Diffie-Hellman key derivation algorithms to generate IPsec security association (SA) keys. Each group has a different size modulus. A larger modulus provides higher security, but requires more processing time. You must have a matching modulus group on both peers.

Tip

---

If you select AES encryption, to support the large key sizes required by AES, ISAKMP negotiation should use Diffie-Hellman (DH) Group 5 or higher. For IKEv1, ASA devices support groups 2 and 5 only.

---

- Diffie-Hellman Group 1: 768-bit modulus. Use to generate IPsec SA keys where the prime and generator numbers are 768 bits.
- Diffie-Hellman Group 2: 1024-bit modulus. Use to generate IPsec SA keys where the prime and generator numbers are 1024 bits. Cisco VPN Client Version 3.x or higher requires a minimum of Group 2.
- Diffie-Hellman Group 5: 1536-bit modulus. Use to generate IPsec SA keys where the prime and generator numbers are 2048 bits. Considered good protection for 128-bit keys, but group 14 is better.
- Diffie-Hellman Group 7: Use to generate IPsec SA keys when the elliptical curve field size is 163 characters. Group 7 is not supported on a Catalyst 6500/7600 device with VPNSM or VPN SPA configuration.
- Diffie-Hellman Group 14: 2048-bit modulus. Considered good protection for 128-bit keys. (ASA 9.0.1+ devices only).
- Diffie-Hellman Group 15: 3072-bit modulus. Considered good protection for 192-bit keys.
- Diffie-Hellman Group 16: 4096-bit modulus. Considered good protection for 256-bit keys.
- Diffie-Hellman Group 19: (256-bit elliptical curve field size). (ASA 9.0.1+ devices only).
- Diffie-Hellman Group 20: (384-bit elliptical curve field size). (ASA 9.0.1+ devices only).
- Diffie-Hellman Group 21: (521-bit elliptical curve field size). (ASA 9.0.1+ devices only).
- Diffie-Hellman Group 24: ( 2048-bit modulus and 256-bit prime order subgroup). (ASA 9.0.1+ devices only).

## Deciding Which Authentication Method to Use

Security Manager supports two methods for peer device authentication in a VPN communication:

- **Preshared Key**—Preshared keys allow for a secret key to be shared between two peers and to be used by IKE during the authentication phase. The same shared key must be configured at each peer or the IKE SA cannot be established.

To use IKE successfully with this device authentication method, you must define various preshared key parameters. For more information, see the appropriate topic:

- Site-to-site VPN, IKEv1 configuration—See [Configuring IKEv1 Preshared Key Policies, page 25-44](#).
  - Site-to-site VPN, IKEv2 configuration—See [Configuring IKEv2 Authentication in Site-to-Site VPNs, page 25-62](#).
  - Remote access IPsec VPN, IKEv1—Configured on the IPsec tab of the connection profile. See [IPSec Tab \(Connection Profiles\), page 30-16](#).
  - Remote access IPsec VPN, IKEv2—You cannot use preshared keys when using IKEv2 in a remote access IPsec VPN. You must use certificates.
- **Certificate**—An authentication method in which RSA key pairs are used to sign and encrypt IKE key management messages. Certificates provide non-repudiation of communication between two peers, meaning that it can be proved that the communication actually took place. When using this authentication method, peers are configured to obtain digital certificates from a Certification Authority (CA). CAs manage certificate requests and issue certificates to participating IPsec network devices. These services provide centralized key management for the participating devices.

While the use of preshared keys does not scale well, using a CA does improve the manageability and scalability of your IPsec network. With a CA, you do not need to configure keys between all encrypting devices. Instead, each participating device is registered with the CA, and requests a certificate from the CA. Each device that has its own certificate and the public key of the CA can authenticate every other device within a given CA's domain.

To use IKE successfully with the Certificate authentication method, you must define parameters for CA authentication and enrollment. For more information, see the appropriate topic:

- Site-to-site VPN, IKEv1 configuration—See [Understanding Public Key Infrastructure Policies, page 25-47](#).
- Site-to-site VPN, IKEv2 configuration—[Configuring IKEv2 Authentication in Site-to-Site VPNs, page 25-62](#).
- Remote access IPsec VPN, IKEv1—Configured on the IPsec tab of the connection profile as explained in [IPSec Tab \(Connection Profiles\), page 30-16](#). You must also configure the Public Key Infrastructure policy with the same trustpoint; see [Understanding Public Key Infrastructure Policies, page 25-47](#).
- Remote access IPsec VPN, IKEv2—Configure the global trustpoint on the IKEv2 Settings tab of the Global Settings policy as explained in [Configuring VPN Global IKEv2 Settings, page 25-34](#). You must also configure the Public Key Infrastructure policy with the same trustpoint; see [Understanding Public Key Infrastructure Policies, page 25-47](#).

## Configuring an IKE Proposal

In Security Manager, an IKE proposal is a mandatory policy when you configure a site-to-site or remote access IPsec VPN. When you use the configuration wizard to create a new IPsec VPN, an IKE Proposal policy is automatically assigned to the VPN; the policy might be the factory default, or it might be a shared policy specifically selected for the VPN. For more information about the IKE (Internet Key Exchange) key management protocol, see [Understanding IKE, page 25-5](#).

Use the IKE Proposal policy to examine the current IKE proposals and to configure new proposals except for GET VPN topologies. For GET VPN, see [Configuring the IKE Proposal for GET VPN, page 28-15](#).

**Tips**

- For site-to-site VPNs, you can select at most one IKE proposal per IKE version. For remote access IPsec VPNs, you can select multiple proposals for each IKE version; select all IKE proposals that are allowed in the remote access VPN.
- To configure IKEv2 (version 2), the device must be an ASA running ASA Software release 8.4(1) or higher.
- The IPsec Proposal policy must enable IKEv1, IKEv2, or both, to match the IKE proposals you configure in this policy. In cases where you cannot configure IKEv2 in the IPsec proposal, such as in Easy VPN topologies, IKEv2 is not supported. For more information, see [Understanding IPsec Proposals, page 25-17](#).
- The IKEv1 Proposal objects specify whether preshared keys or certificates are used for authentication. You must configure the appropriate policies to configure preshared keys or Public Key Infrastructure settings. For IKEv2, the object does not specify whether preshared keys or certificates are used, but other policies must define the authentication requirements. For more information, see [Deciding Which Authentication Method to Use, page 25-8](#).

**Related Topics**

- [Deciding Which Hash Algorithm to Use, page 25-6](#)

- [Deciding Which Authentication Method to Use, page 25-8](#)

- 
- Step 1** Do one of the following to open the IKE Proposal policy based on the type of VPN you are configuring:
- For remote access VPNs, do one of the following:
    - (Device View) Select **Remote Access VPN > IPsec VPN > IKE Proposal** from the Policy selector.
    - (Policy View) Select **Remote Access VPN > IPsec VPN > IKE Proposal** from the Policy Type selector. Select an existing policy or create a new one.
  - For site-to-site VPNs, do one of the following:
    - Open the [Site-to-Site VPN Manager Window, page 24-18](#), select a topology (other than GET VPN) in the VPNs selector, then select **IKE Proposal** in the Policies selector.

- (Policy view) Select **Site-to-Site VPN > IKE Proposal** from the Policy Types selector. Select an existing shared policy or create a new one.

**Step 2** In each of the **IKEv1 Proposals** and **IKEv2 Proposals** fields, click **Select** to choose the policy objects that define the settings for an IKE version 1 or version 2 proposal. Configure proposals only for those IKE versions supported in the VPN.

- To select an IKE proposal for site-to-site VPNs, simply highlight it in the available proposals list. For remote access IPsec VPNs, highlight the desired objects in the available proposals list and click >> to move them to the selected proposals list.
- To remove an IKE proposal for remote access IPsec VPNs, highlight it in the selected proposals list and click << to move it to the available proposals list.
- To create a new IKE proposal, click the **Create (+)** button beneath the available proposals list. The Add IKEv1 or IKEv2 Proposal dialog box opens. For instructions on creating the object, see the following topics:
  - [Configuring IKEv1 Proposal Policy Objects, page 25-10](#)
  - [Configuring IKEv2 Proposal Policy Objects, page 25-13](#)
- To edit an object, or to view its settings, select it and click the **Edit (pencil)** button beneath the list.

## Configuring IKEv1 Proposal Policy Objects

Use the IKEv1 Proposal dialog box to create, copy, and edit an IKEv1 proposal object.

Internet Key Exchange (IKE) version 1 proposal objects contain the parameters required for IKEv1 proposals when defining remote access and site-to-site VPN policies. IKE is a key management protocol that facilitates the management of IPsec-based communications. It is used to authenticate IPsec peers, negotiate and distribute IPsec encryption keys, and automatically establish IPsec security associations (SAs).

The IKE negotiation comprises two phases. Phase 1 negotiates a security association between two IKE peers, which enables the peers to communicate securely in Phase 2. During Phase 2 negotiation, IKE establishes security associations (SAs) for other applications, such as IPsec. Both phases use proposals when they negotiate a connection. For more information about IKE proposals, see the following topics:

- [Overview of IKE and IPsec Configurations, page 25-2](#)
- [Comparing IKE Version 1 and 2, page 25-4](#)
- [Understanding IKE, page 25-5](#)

| Name                 | The name of the policy object. A maximum of 128 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Description          | A description of the policy object. A maximum of 1024 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Priority             | <p>The priority value of the IKE proposal. The priority value determines the order of the IKE proposals compared by the two negotiating peers when attempting to find a common security association (SA). If the remote IPsec peer does not support the parameters selected in your first priority policy, the device tries to use the parameters defined in the policy with the next lowest priority number.</p> <p>Valid values range from 1 to 10000. The lower the number, the higher the priority. If you leave this field blank, Security Manager assigns the lowest unassigned value starting with 1, then 5, then continuing in increments of 5.</p>                                                                                               |
| Encryption Algorithm | <p>The encryption algorithm used to establish the Phase 1 SA for protecting Phase 2 negotiations:</p> <ul style="list-style-type: none"> <li>• AES-128—Encrypts according to the Advanced Encryption Standard using 128-bit keys.</li> <li>• AES-192—Encrypts according to the Advanced Encryption Standard using 192-bit keys.</li> <li>• AES-256—Encrypts according to the Advanced Encryption Standard using 256-bit keys.</li> <li>• DES—Encrypts according to the Data Encryption Standard using 56-bit keys.</li> <li>• 3DES—Encrypts three times using 56-bit keys. 3DES is more secure than DES, but requires more processing for encryption and decryption. It is less secure than AES. A 3DES license is required to use this option.</li> </ul> |

Table 25-1 IKEv1 Proposal Dialog Box (Continued)

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hash Algorithm | <p>The hash algorithm used in the IKE proposal. The hash algorithm creates a message digest, which is used to ensure message integrity. Options are:</p> <ul style="list-style-type: none"> <li>• SHA (Secure Hash Algorithm)—Produces a 160-bit digest. SHA is more resistant to brute-force attacks than MD5.</li> <li>• MD5 (Message Digest 5)—Produces a 128-bit digest. MD5 uses less processing time than SHA.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Modulus Group  | <p>The Diffie-Hellman group to use for deriving a shared secret between the two IPsec peers without transmitting it to each other. A larger modulus provides higher security but requires more processing time. The two peers must have a matching modulus group. Options are:</p> <p><b>Tip</b> For IKEv1, ASA devices support groups 2 and 5 only.</p> <ul style="list-style-type: none"> <li>• 1—Diffie-Hellman Group 1 (768-bit modulus).</li> <li>• 2—Diffie-Hellman Group 2 (1024-bit modulus).</li> <li>• 5—Diffie-Hellman Group 5 (1536-bit modulus, considered good protection for 128-bit keys, but group 14 is better). If you are using AES encryption, use this group (or higher).</li> <li>• 7—Diffie-Hellman Group 7 (163-bit elliptical curve field size).</li> <li>• 14—Diffie-Hellman Group 14 (2048-bit modulus, considered good protection for 128-bit keys).</li> <li>• 15—Diffie-Hellman Group 15 (3072-bit modulus, considered good protection for 192-bit keys).</li> <li>• 16—Diffie-Hellman Group 16 (4096-bit modulus, considered good protection for 256-bit keys).</li> </ul> <p><b>Note</b> Although Diffie-Hellman groups 19-24 are listed, they are not supported for IKEv1 and will cause a validation error if selected for IKEv1 policies.</p> |
| Lifetime       | <p>The lifetime of the security association (SA), in seconds. When the lifetime is exceeded, the SA expires and must be renegotiated between the two peers. As a general rule, the shorter the lifetime (up to a point), the more secure your IKE negotiations will be. However, with longer lifetimes, future IPsec security associations can be set up more quickly than with shorter lifetimes.</p> <p>You can specify a value from 60 to 2147483647 seconds. The default is 86400.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Authentication Method | <p>The method of authentication to use between the two peers. For information on how this selection determines which other policies you must configure, see <a href="#">Deciding Which Authentication Method to Use, page 25-8</a>. Select one of the following:</p> <ul style="list-style-type: none"> <li>• <b>Preshared Key</b>—Preshared keys allow for a secret key to be shared between two peers and to be used by IKE during the authentication phase. If one of the participating peers is not configured with the same preshared key, the IKE SA cannot be established.</li> <li>• <b>Certificate</b>—An authentication method in which RSA key pairs are used to sign and encrypt IKE key management messages. This method provides non-repudiation of communication between two peers, meaning that it can be proved that the communication actually took place. When you use this authentication method, the peers are configured to obtain digital certificates from a Certification Authority (CA).</li> </ul> |
| Category              | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-12</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Configuring IKEv2 Proposal Policy Objects

Use the IKEv2 Proposal dialog box to create, copy, and edit an IKEv2 proposal object. You can use IKEv2 proposals with ASA Software release 8.4(1)+ only.

Internet Key Exchange (IKE) version 2 proposal objects contain the parameters required for IKEv2 proposals when defining remote access and site-to-site VPN policies. IKE is a key management protocol that facilitates the management of IPsec-based communications. It is used to authenticate IPsec peers, negotiate and distribute IPsec encryption keys, and automatically establish IPsec security associations (SAs).

The IKE negotiation comprises two phases. Phase 1 negotiates a security association between two IKE peers, which enables the peers to communicate securely in Phase 2. During Phase 2 negotiation, IKE establishes security associations (SAs) for other applications, such as IPsec. Both phases use proposals when they negotiate a connection. Unlike IKEv1, in an IKEv2 proposal, you can select multiple algorithms and modulus groups from which peers can choose during the Phase 1 negotiation. For more information about IKE proposals, see the following topics:

- [Overview of IKE and IPsec Configurations, page 25-2](#)
- [Comparing IKE Version 1 and 2, page 25-4](#)
- [Understanding IKE, page 25-5](#)
- [Deciding Which Encryption Algorithm to Use, page 25-6](#)
- [Deciding Which Hash Algorithm to Use, page 25-6](#)
- [Deciding Which Diffie-Hellman Modulus Group to Use, page 25-7](#)

**Tip**

Unlike IKEv1, you do not specify the authentication method in the IKE proposal. For more information on how to configure the authentication method in IKEv2, see [Deciding Which Authentication Method to Use, page 25-8](#).

**Navigation Path**

Select **Manage > Policy Objects**, then select **IKE Proposals > IKEv2 Proposals** from the Object Type Selector. Right-click inside the work area, then select **New Object** or right-click a row, then select **Edit Object**.

**Tip**

You can also access this dialog box when configuring the IKE Proposal policy as explained in [Configuring an IKE Proposal, page 25-9](#).

| Element     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name        | The name of the policy object. A maximum of 128 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Description | A description of the policy object. A maximum of 1024 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Priority    | The priority value of the IKE proposal. The priority value determines the order of the IKE proposals compared by the two negotiating peers when attempting to find a common security association (SA). If the remote IPsec peer does not support the parameters selected in your first priority policy, the device tries to use the parameters defined in the policy with the next lowest priority number.<br><br>Valid values range from 1 to 65535. The lower the number, the higher the priority. If you leave this field blank, Security Manager assigns the lowest unassigned value starting with 1, then 5, then continuing in increments of 5. |

| Element                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Integrity (Hash) Algorithm | <p>The integrity portion of the hash algorithm used in the IKE proposal. The hash algorithm creates a message digest, which is used to ensure message integrity. Click <b>Select</b> and select all of the algorithms that you want to allow in the VPN:</p> <p><b>Note</b> If using AES-GCM, AES-GCM-192, or AES-GCM-256, you must select Null as the Integrity Algorithm.</p> <ul style="list-style-type: none"> <li>• SHA (Secure Hash Algorithm)—SHA is more resistant to brute-force attacks than MD5.<br/>Standard SHA produces a 160-bit digest.<br/>The following options, which are even more secure, are available for IKEv2 configurations on ASA 8.4(2+) devices: <ul style="list-style-type: none"> <li>– SHA512—A 512-bit key.</li> <li>– SHA384—A 384-bit key.</li> <li>– SHA256—A 256-bit key.</li> </ul> </li> <li>• MD5 (Message Digest 5)—Produces a 128-bit digest. MD5 uses less processing time than SHA.</li> <li>• Null—No encryption algorithm. For use with AES-GCM, AES-GCM-192, and AES-GCM-256 only.</li> </ul> |
| Prf Algorithm              | <p>The pseudo-random function (PRF) portion of the hash algorithm used in the IKE proposal. In IKEv1, the Integrity and PRF algorithms are not separated, but in IKEv2, you can specify different algorithms for these elements. Click <b>Select</b> and select all of the algorithms that you want to allow in the VPN. The options are described above under Integrity Algorithm.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

Table 25-2 IKEv2 Proposal Dialog Box (Continued)

| Element       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Modulus Group | <p>The Diffie-Hellman group to use for deriving a shared secret between the two IPsec peers without transmitting it to each other. A larger modulus provides higher security but requires more processing time. The two peers must have a matching modulus group. Click <b>Select</b> and select all of the groups that you want to allow in the VPN:</p> <ul style="list-style-type: none"> <li>• 1—Diffie-Hellman Group 1 (768-bit modulus).</li> <li>• 2—Diffie-Hellman Group 2 (1024-bit modulus).</li> <li>• 5—Diffie-Hellman Group 5 (1536-bit modulus, considered good protection for 128-bit keys, but group 14 is better). If you are using AES encryption, use this group (or higher).</li> <li>• 14—Diffie-Hellman Group 14 (2048-bit modulus, considered good protection for 128-bit keys). (ASA 9.0.1+ devices only).</li> <li>• 19—Diffie-Hellman Group 19 (256-bit elliptical curve field size). (ASA 9.0.1+ devices only).</li> <li>• 20—Diffie-Hellman Group 20 (384-bit elliptical curve field size). (ASA 9.0.1+ devices only).</li> <li>• 21—Diffie-Hellman Group 21 (521-bit elliptical curve field size). (ASA 9.0.1+ devices only).</li> <li>• 24—Diffie-Hellman Group 24 (2048-bit modulus and 256-bit prime order subgroup). (ASA 9.0.1+ devices only).</li> </ul> |
| Lifetime      | <p>The lifetime of the security association (SA), in seconds. When the lifetime is exceeded, the SA expires and must be renegotiated between the two peers. As a general rule, the shorter the lifetime (up to a point), the more secure your IKE negotiations will be. However, with longer lifetimes, future IPsec security associations can be set up more quickly than with shorter lifetimes.</p> <p>You can specify a value from 120 to 2147483647 seconds. The default is 86400.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Category      | <p>The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a>, page 6-12.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Understanding IPsec Proposals

IPsec is one of the most secure methods for setting up a VPN. IPsec provides data encryption at the IP packet level, offering a robust security solution that is standards-based. With IPsec, data is transmitted over a public network through tunnels. A tunnel is a secure, logical communication path between two peers, which can be devices in a site-to-site VPN or a device and user in remote access IPsec VPNs. Traffic that enters an IPsec tunnel is secured by a combination of security protocols and algorithms called a transform set.

An IPsec proposal is used in Phase 2 of an IKE negotiation, as explained in [Understanding IKE](#), page 25-5. The specific content of the proposal varies according to topology type (site-to-site or remote access) and device type, although the proposals are broadly similar and contain many of the same elements, such as IPsec transform sets.

The following topics explain IPsec proposal concepts and procedures in more detail:

## Understanding IPsec Proposals for Site-to-Site VPNs

IPsec is one of the most secure methods for setting up a VPN. IPsec provides data encryption at the IP packet level, offering a robust security solution that is standards-based. Pure IPsec configurations cannot use routing protocols—the policy created is used for pure IPsec provisioning. You can configure pure IPsec on Cisco IOS routers, PIX Firewalls, Catalyst VPN Service Modules, and Adaptive Security Appliance (ASA) devices.

With IPsec, data is transmitted over a public network through tunnels. A tunnel is a secure, logical communication path between two peers. Traffic that enters an IPsec tunnel is secured by a combination of security protocols and algorithms called a transform set.

In Security Manager, you use an IPsec Proposal policy to define the settings required for a IPsec tunnels. An IPsec proposal is a collection of one or more crypto maps that are applied to the VPN interfaces on the devices. A crypto map combines all the components required to set up IPsec security associations, including transform sets. A crypto map can also be configured with Reverse Route Injection (RRI).

The following topics provide more information:

## Understanding Crypto Maps

A crypto map combines all components required to set up IPsec security associations (SA), including IPsec rules, transform sets, remote peers, and other parameters that might be necessary to define an IPsec SA. A crypto map entry is a named series of CLI commands. Crypto map entries with the same crypto map name (but different map sequence numbers) are grouped into a crypto map set, which is applied to the VPN interfaces on relevant devices. All IP traffic passing through the interface is evaluated against the applied crypto map set.

When two peers try to establish an SA, they must each have at least one compatible crypto map entry. The transform set defined in the crypto map entry is used in the IPsec security negotiation to protect the data flows specified by that crypto map's IPsec rules.

Dynamic crypto map policies are used in site-to-site VPNs when an unknown remote peer tries to initiate an IPsec security association with the local hub. The hub cannot be the initiator of the security association negotiation. Dynamic crypto policies allow remote peers to exchange IPsec traffic with a local hub even if the hub does not know the remote peer's identity. You can create a dynamic crypto policy on individual hubs or on a device group that contains hubs. The policy is written only to the hubs, not to any spokes that might be contained in the group. A dynamic crypto map policy essentially creates a crypto map entry without all the parameters configured. The missing parameters are later dynamically configured (as the result of an IPsec negotiation) to match a remote peer's requirements. The peer addresses for dynamic or static crypto maps are deduced from the VPN topology.

Dynamic crypto map policies apply only in a hub-and-spoke VPN configuration—in a point-to-point or full mesh VPN topology, you can apply only static crypto map policies.

**Note**

(Site-to-site VPNs.) Except for Extranet VPNs, Security Manager can manage an existing VPN tunnel only if the tunnel's peers are managed by Security Manager. In such a case, Security Manager uses the same crypto map name for the tunnel on the peers. On subsequent deployments, only Security Manager tunnels are managed (Security Manager maintains a log of all tunnels that were configured).

## Understanding Transform Sets

A transform set is a combination of security protocols and algorithms that secure traffic in an IPsec tunnel. During the IPsec security association (SA) negotiation, peers search for a transform set that is the same at both peers. When such a transform set is found, it is applied to create an SA that protects data flows in the access list for that crypto map, protecting the traffic in the VPN.

There are separate IPsec transform sets for IKEv1 and IKEv2. With IKEv1 transform sets, for each parameter, you set one value. For IKEv2 transform sets, you can configure multiple encryption and integration algorithms for a single proposal. ASA devices order the settings from the most secure to the least secure and negotiate with the peer using that order. This allows you to potentially send a single proposal to convey all the allowed combinations instead of the need to send each allowed combination individually as with IKEv1.

You can specify a number of transform sets per IPsec proposal policy. If you are defining the policy on a spoke or a group of spokes, you do not usually have to specify more than one transform set. This is because the spoke's assigned hub would typically be a higher performance router capable of supporting any transform set that the spoke supports. However, if you are defining the policy on a hub for dynamic crypto, you should specify more than one transform set to ensure that there will be a transform set match between the hub and the unknown spoke. If more than one of your selected transform sets is supported by both peers, the transform set that provides the highest security is used.

Security Manager provides predefined transform sets that you can use in your tunnel policies. You can also create your own transform sets. For more information, see [Configuring IPsec IKEv1 or IKEv2 Transform Set Policy Objects, page 25-25](#).

### Selecting Tunnel Mode for IKEv1 Transform Sets

When defining an IKEv1 transform set, you must specify which IPsec mode of operation to use—tunnel mode or transport mode. You can use the AH and ESP protocols to protect an entire IP payload (Tunnel mode) or just the upper-layer protocols of an IP payload (Transport mode).

In tunnel mode (the default), the entire original IP datagram is encrypted, and it becomes the payload in a new IP packet. This mode allows a router to act as an IPsec proxy. That is, the router performs encryption on behalf of the hosts. The source's router encrypts packets and forwards them along the IPsec tunnel. The destination's router decrypts the original IP datagram and forwards it on to the destination system. The major advantage of tunnel mode is that the end systems do not need to be modified to enjoy the benefits of IPsec. Tunnel mode also protects against traffic analysis. With tunnel mode, an attacker can only determine the tunnel endpoints and not the true source and destination of the tunneled packets, even if they are the same as the tunnel endpoints.

In transport mode, only the IP payload is encrypted, and the original IP headers are left intact. This mode has the advantage of adding only a few bytes to each packet. It also allows devices on the public network to see the final source and destination of the packet. However, by passing the IP header in the clear, transport mode allows an attacker to perform some traffic analysis. For example, an attacker could see when a company's CEO sent many packets to another senior executive. However, the attacker would only know that IP packets were sent; the attacker would not be able to decipher the contents of the packets. With transport mode, the destination of the flow must be an IPsec termination device.

#### Note

You cannot use transport mode for VPN topologies using regular IPsec or Easy VPN.

## Understanding Reverse Route Injection

Reverse Route Injection (RRI) enables static routes to be automatically inserted into the routing process for those networks and hosts protected by a remote tunnel endpoint. These protected hosts and networks are known as remote proxy identities. Each route is created on the basis of the remote proxy network and mask, with the next hop to this network being the remote tunnel endpoint. By using the remote VPN router as the next hop, the traffic is forced through the crypto process to be encrypted.

After the static route is created on the VPN router, this information is propagated to upstream devices, allowing them to determine the appropriate VPN router to which to send returning traffic in order to maintain IPsec state flows. This is particularly useful if multiple VPN routers are used at a site to provide load balancing or failover, or if the remote VPN devices are not accessible through a default route. Routes are created in either the global routing table or the appropriate virtual route forwarding (VRF) table.

#### Note

Security Manager automatically configures RRI on devices with High Availability (HA) or on the IPsec Aggregator when VRF-Aware IPsec is configured. You can also configure RRI on a device's crypto map in a remote access VPN. See [Configuring an IPsec Proposal on a Remote Access VPN Server \(ASA, PIX 7.0+ Devices\), page 30-33](#) and [Configuring an IPsec Proposal on a Remote Access VPN Server \(IOS, PIX 6.3 Devices\), page 32-3](#).

In Security Manager, the following options are available for configuring Reverse Route Injection:

- For dynamic crypto maps, routes are created upon the successful establishment of IPsec security associations (SAs) for those remote proxies. The next hop back to those remote proxies is through the remote VPN router whose address is learned and applied during the creation of the dynamic crypto map template. The routes are deleted after the SAs are deleted.
- The Remote Peer option (available for IOS devices only) enables you to specify an interface or address as the explicit next hop to the remote VPN device. Two routes are created. One route is the standard remote proxy ID and the next hop is the remote VPN client tunnel address. The second route is the actual route to the remote tunnel endpoint, when a recursive lookup is forced to impose that the remote endpoint is reachable via “next-hop.” Creation of the second route for the actual next hop is very important for VRF-Aware IPsec when a default route must be overridden by a more explicit route.

---

**Note** For devices using a VPN Services Module (VPNSM), the next hop is the interface or subinterface/VLAN on which the crypto map is applied.

---

- In the case of Remote Peer IP (available for IOS devices only), one route is created to a remote proxy by way of a user-defined next hop. The next hop can be used to override a default route to properly direct outgoing encrypted packets. This option reduces the number of routes created and supports those platforms that do not readily facilitate route recursion.

## Configuring IPsec Proposals in Site-to-Site VPNs

Use the IPsec Proposal page to configure the IPsec proposal used during IKE Phase 2 negotiations for site-to-site VPN topologies with the exception of Easy VPN topologies.

IPsec proposals used with Easy VPN topologies, and with remote access VPNs, are significantly different than the basic site-to-site proposal explained in this topic. For information on IPsec proposals in these other topologies, see the following topics:

- [Configuring an IPsec Proposal for Easy VPN, page 27-10](#)
- [Configuring an IPsec Proposal on a Remote Access VPN Server \(ASA, PIX 7.0+ Devices\), page 30-33](#)
- [Configuring an IPsec Proposal on a Remote Access VPN Server \(IOS, PIX 6.3 Devices\), page 32-3](#)

#### Navigation Path

- ([Site-to-Site VPN Manager Window, page 24-18](#)) Select a non-Easy VPN topology in the VPNs selector, then select **IPsec Proposal** in the Policies selector. If necessary, click the **IPsec Proposal** tab.
- (Policy view) Select **Site-to-Site VPN > IPsec Proposal** from the Policy Types selector. Select an existing shared policy or create a new one.

The QoS features on the output interface classify packets and apply the appropriate QoS service before the data is encrypted and tunneled, enabling traffic flows to be adjusted in congested environments, and resulting in more effective packet tunneling.</p>                                                                                                  |

## Selecting the IKE Version for Devices in Site-to-Site VPNs

Use the IKE Version tab in the IPsec Proposal page to select which version of IKE to use for each device in a hub-and-spoke or full mesh site-to-site VPN. This tab appears only in the Site-to-Site VPN Manager; you cannot configure the options in Policy view, because they are specific to the actual devices in a VPN topology.

The IKE Version tab contains two lists: IKEv1 Enabled Peers and IKEv2 Enabled Peers. When you configure the IPsec proposal, as described in [Configuring IPsec Proposals in Site-to-Site VPNs, page 25-21](#), you select which IKE versions to allow in the VPN (version 1, version 2, or both). Security Manager automatically chooses which IKE version to use for a device based on the OS version used by the device. For example, IOS routers always appear in the IKEv1 Enabled Peers list. If a device supports both IKEv1 and IKEv2, it appears in both lists.

You need to alter the selection only if you are allowing both IKE versions in a VPN and you want to specifically prevent some IKEv2-capable devices from using one of the IKE versions.

To change which IKE version is allowed for a device, click the **Select** button beneath the list from which you want to remove the device (or to add the device after previously removing it). A selection dialog box opens where you can do the following (click **OK** to confirm your choices):

- To remove a device, so that it cannot use the IKE version, highlight it in the Selected Peers list and click << to move it to the Available Peers list.
- To add a device, so that it is allowed to use the IKE version, highlight it in the Available Peers list and click >> to move it to the Selected Peers list.

**Tip**

The selection lists include only those devices that support both IKE versions, because you cannot change the version selection for devices that support a single version. IKEv2 is supported on ASA Software 8.4(1)+.

### Navigation Path

([Site-to-Site VPN Manager Window, page 24-18](#)) Select a non-Easy VPN topology in the VPNs selector, then select **IPsec Proposal** in the Policies selector. Click the **IKE Version** tab.

## Configuring IPsec IKEv1 or IKEv2 Transform Set Policy Objects

Use the Add or Edit IPsec Transform Set dialog box to configure IPsec transform sets for use in IKE negotiations.

You can create IPsec transform set objects for use in IPsec proposals when defining IPsec-protected traffic in site-to-site and remote access VPNs. During IPsec security association negotiation, the peers agree to use a particular transform set when protecting a particular data flow.

Two different security protocols are included within the IPsec standard:

- Encapsulating Security Protocol (ESP)—Provides authentication, encryption, and anti-replay services. ESP is IP protocol type 50.

- Authentication Header (AH)—Provides authentication and anti-replay services. AH does not provide encryption and has largely been superseded by ESP. It is also supported on routers only. AH is IP protocol type 51.

**Note**

We recommend using both encryption and authentication on IPsec tunnels.

There are separate IPsec transform set objects based on the IKE version, IKEv1 or IKEv2:

- When you create an IPsec IKEv1 transform set object, you select the mode in which IPsec should operate, as well as define the required encryption and authentication types. Additionally, you can select whether to include compression in the transform set. You can select single options for the algorithms, so if you want to support multiple combinations in a VPN, you must create multiple IPsec IKEv1 transform set objects.
- When you create an IPsec IKEv2 transform set object, you can select all of the encryption and hash algorithms that you will allow in a VPN. During IKEv2 negotiations, the peers select the most appropriate options that each support.

**Navigation Path**

Select **Manage > Policy Objects**, then select **IPsec Transform Sets > IPsec IKEv1 Transform Sets** or **IPsec Transform Sets > IPsec IKEv2 Transform Sets** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

| Mode<br>(IKEv1 only.) | <p>The mode in which the IPsec tunnel operates:</p> <ul style="list-style-type: none"> <li>• <b>Tunnel</b>—Tunnel mode encapsulates the entire IP packet. The IPsec header is added between the original IP header and a new IP header. This is the default.<br/><br/>Use tunnel mode when the firewall is protecting traffic to and from hosts positioned behind the firewall. Tunnel mode is the normal way regular IPsec is implemented between two firewalls (or other security gateways) that are connected over an untrusted network, such as the Internet.</li> <li>• <b>Transport</b>—Transport mode encapsulates only the upper-layer protocols of an IP packet. The IPsec header is inserted between the IP header and the upper-layer protocol header (such as TCP).<br/><br/>Transport mode requires that both the source and destination hosts support IPsec, and can only be used when the destination peer of the tunnel is the final destination of the IP packet. Transport mode is generally used only when protecting a Layer 2 or Layer 3 tunneling protocol such as GRE, L2TP, and DLSW.</li> </ul> |

## Configuring VPN Global Settings

You can define global settings that apply to all devices in your remote access or site-to-site VPN topology. These settings include Internet Key Exchange (IKE), IKEv2, IPsec, NAT, and fragmentation definitions. The global settings typically have defaults that work in most situations, so configuring the Global Settings policy is optional in most cases; configure it only if you need non-default behavior or if you are supporting IKEv2 negotiations in a remote access IPsec VPN.

### Note

The VPN Global Settings policy for site-to-site VPNs applies to all technologies except GET VPN. For an explanation of global settings for GET VPN, see [Configuring Global Settings for GET VPN, page 28-16](#).

### Step 1

Do one of the following to open the global settings policy based on the type of VPN you are configuring:

- For remote access VPNs, do one of the following:

- (Device View) Select **Remote Access VPN > Global Settings** from the Policy selector.
- (Policy View) Select **Remote Access VPN > Global Settings** from the Policy Type selector. Select an existing policy or create a new one.
- For site-to-site VPNs, do one of the following:
  - Open the [Site-to-Site VPN Manager Window, page 24-18](#), select a topology in the VPNs selector, then select **VPN Global Settings** in the Policies selector.
  - (Policy view) Select **Site-to-Site VPN > VPN Global Settings** from the Policy Types selector. Select an existing shared policy or create a new one.

**Step 2** Select the desired tab and configure the settings as needed:

- **ISAKMP/IPsec Settings**—To configure global settings for IKE and IPsec. For detailed information about the options, see [Configuring VPN Global ISAKMP/IPsec Settings, page 25-30](#).
- **IKEv2 Settings**—To configure global settings for IKE version 2 negotiations. For detailed information about the options, see [Configuring VPN Global IKEv2 Settings, page 25-34](#).
- **NAT Settings**—To configure NAT behavior. For detailed information about the options, see [Configuring VPN Global NAT Settings, page 25-38](#). Also see [Understanding NAT in VPNs, page 25-37](#).
- **General Settings**—To configure fragmentation behavior and some other miscellaneous options. For detailed information about the options, see [Configuring VPN Global General Settings, page 25-40](#).

## Configuring VPN Global ISAKMP/IPsec Settings

Use the ISAKMP/IPsec Settings tab of the VPN Global Settings page to specify global settings for Internet Key Exchange (IKE) and IPsec.

The Internet Key Exchange (IKE) protocol, also called the Internet Security Association and Key Management Protocol (ISAKMP) is the negotiation protocol that lets two hosts agree on how to build an IPsec security association. Each ISAKMP negotiation is divided into a Phase 1 and Phase 2. Phase 1 creates the first tunnel, which protects ISAKMP negotiation messages. Phase 2 creates the tunnel that protects data.

To set terms for ISAKMP negotiations, you create an IKE proposal. For more information, see [Configuring an IKE Proposal, page 25-9](#).

### About IKE Keepalive

With IKE keepalive, tunnel peers exchange messages that demonstrate they are available to send and receive data in the tunnel. Keepalive messages transmit at set intervals, and any disruption in that interval results in the creation of a new tunnel, using a backup device.

Devices that rely on IKE keepalive for resiliency transmit their keepalive messages regardless of whether they are exchanging other information. These keepalive messages can therefore create a small but additional demand on your network.

A variation on IKE keepalive called keepalive dead-peer detection (DPD) sends keepalive messages between peer devices only when no incoming traffic is received and outbound traffic needs to be sent. If you want to send DPD keepalive messages when no incoming traffic is received regardless of whether there is any outbound traffic, you can specify this using the Periodic option.

**Navigation Path**

- For remote access VPNs, do one of the following:
  - (Device View) Select **Remote Access VPN > Global Settings** from the Policy selector. Click the **ISAKMP/IPsec Settings** tab.
  - (Policy View) Select **Remote Access VPN > Global Settings** from the Policy Type selector. Select an existing policy or create a new one, then click the **ISAKMP/IPsec Settings** tab.
- For site-to-site VPNs, do one of the following:
  - Open the [Site-to-Site VPN Manager Window, page 24-18](#), select a topology in the VPNs selector, then select **VPN Global Settings** in the Policies selector. Click the **ISAKMP/IPsec Settings** tab.
  - (Policy view) Select **Site-to-Site VPN > VPN Global Settings** from the Policy Types selector. Select an existing shared policy or create a new one, then click the **ISAKMP/IPsec Settings** tab.

| <b>ISAKMP Settings</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Enable Keepalive       | <p>Whether to configure dead-peer detection (DPD) settings. If the peer fails to respond, a new tunnel is constructed on the assumption that the peer is no longer available. IKE keepalive is defined on the spokes in a hub-and-spoke VPN topology, on both devices in a point-to-point VPN topology, or in remote access VPN configurations.</p> <p>Configure the following options:</p> <ul style="list-style-type: none"> <li>• <b>Interval</b>—The number of seconds the peer can be idle before beginning keepalive monitoring. The range is 10-3600 seconds. The default is 10, although the ASA device default for remote access groups is 300.</li> <li>• <b>Retry</b>—The interval in seconds between retries after a keepalive response has not been received. The range is 2-10 seconds for ASA, 2-60 for IOS devices. The default is 2 seconds.</li> <li>• <b>Periodic</b>—(Routers running IOS Software version 12.3(7)T and later, except 7600 devices.) Whether to send DPD keepalive messages at regular intervals regardless of IPsec traffic. This changes how the interval value is used.</li> <li>• <b>Infinite</b>—(ASA only.) Whether to ignore the interval and retry settings and allow the peer to be idle indefinitely.</li> </ul> |

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Xauth Timeout           | <p>Supported on Cisco IOS routers and Catalyst 6500/7600 devices in remote access VPN and Easy VPN topologies only.</p> <p>The number of seconds the device will wait for a system response to the Xauth challenge.</p> <p>When negotiating tunnel parameters for establishing IPsec tunnels in a remote access or Easy VPN configuration, Xauth adds another level of authentication that identifies the user who requests the IPsec connection. Using the Xauth feature, the client waits for a username/password (Xauth) challenge after the IKE SA has been established. When the end user responds to the challenge, the response is forwarded to the IPsec peers for an additional level of authentication.</p>                                                                                                                                                                                                                                                                                                                      |
| Max Sessions            | <p>Supported on ASA devices and PIX 7.0+ devices.</p> <p>The maximum number of security associations (SAs) that can be enabled simultaneously on the device. The maximum number differs based on device model. For ASA devices, the limits are:</p> <ul style="list-style-type: none"> <li>• 5505—10 sessions.</li> <li>• 5510—250 sessions.</li> <li>• 5520—750 sessions.</li> <li>• 5540, 5550, 5585-X with SSP-10—5000 sessions.</li> <li>• 5580, 5585-X (other models)—10000 sessions.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Enable IPsec via Sysopt | <p>Supported on ASA devices, and PIX Firewalls versions 6.3 or 7.0+.</p> <p>Whether to bypass the access rules defined on the VPN interface for VPN traffic.</p> <p>By default, the device allows VPN traffic to terminate on an interface; you do not need to allow IKE or ESP (or other types of VPN packets) in an interface access list. By default, you also do not need an interface access list for local IP addresses of decrypted VPN packets. Because the VPN tunnel was terminated successfully using VPN security mechanisms, this feature simplifies configuration and maximizes the device performance without any security risks. (Group policy and per-user authorization access lists still apply to the traffic.)</p> <p>If you deselect this option, the interface access rules are also applied to VPN traffic. The access list applies to the local IP address and not to the original client IP address used before the VPN packet was decrypted. The command applied is <b>no sysopt connection permit-vpn</b>.</p> |

| Enable PMTU (Path Maximum Transmission Unit) Aging | <p>Supported for IKEv2 on ASA devices versions 9.0.1+.</p> <p>Whether to enable Path Maximum Transmission Unit aging.</p> <p>If you select this option, configure the interval, in minutes, at which the PMTU value is reset to its original value. The value can be from 10 to 30 minutes. The default is 10 minutes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Configuring VPN Global IKEv2 Settings

Use the IKEv2 Settings tab of the VPN Global Settings page to specify global settings for Internet Key Exchange (IKE) version 2. These settings apply to ASA 8.4(x) devices only.

Internet Key Exchange (IKE), also called Internet Security Association and Key Management Protocol (ISAKMP), is the negotiation protocol that lets two hosts agree on how to build an IPsec security association (SA).

### Preventing DoS Attacks by Limiting IKEv2 Open SAs

You can prevent denial-of-service (DoS) attacks for IPsec IKEv2 connections by always cookie challenging incoming security associations (SAs) or by limiting the number of open SAs and cookie challenging any additional connections. By default, the ASA does not limit the number of open SAs and never cookie challenges SAs.

You can also limit the number of SAs allowed, which stops further connections from negotiating to protect against memory or CPU attacks that the cookie-challenge feature may be unable to thwart. Limiting the maximum number of SAs can protect the current connections.

With a DoS attack, an attacker initiates the attack when the peer device sends an SA initiate packet and the ASA sends its response, but the peer device does not respond further. If the peer device does this continually, all the allowed SA requests on the ASA can be used up until it stops responding.

Enabling a threshold percentage for cookie challenges limits the number of open SA negotiations. For example, with the default setting of 50%, when 50% of the allowed SAs are in-negotiation (open), the ASA cookie challenges any additional SA initiate packets that arrive. For the Cisco ASA 5580 with 10,000 allowed IKEv2 SAs, after 5000 SAs become open, any more incoming SAs are cookie-challenged.

If used in conjunction with the **Maximum SAs in Negotiation** option, configure a lower cookie-challenge threshold.

### Navigation Path

- For remote access VPNs, do one of the following:
  - (Device View) Select **Remote Access VPN > Global Settings** from the Policy selector. Click the **IKEv2 Settings** tab.
  - (Policy View) Select **Remote Access VPN > Global Settings** from the Policy Type selector. Select an existing policy or create a new one, then click the **IKEv2 Settings** tab.
- For site-to-site VPNs, do one of the following:
  - Open the [Site-to-Site VPN Manager Window, page 24-18](#), select a topology in the VPNs selector, then select **VPN Global Settings** in the Policies selector. Click the **IKEv2 Settings** tab.
  - (Policy view) Select **Site-to-Site VPN > VPN Global Settings** from the Policy Types selector. Select an existing shared policy or create a new one, then click the **IKEv2 Settings** tab.

| Element                                                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Load Balancing Settings<br>Redirect Connections During<br>(Remote access VPNs only.) | <p>If you configure load balancing, using the ASA Cluster Load Balance policy, you can specify the IKEv2 negotiation phase in which a user can be redirected to another device in the cluster. Select one of these options:</p> <ul style="list-style-type: none"> <li>• <b>INIT</b>—Redirect at unauthenticated initiation requests (the first IKEv2 message IKE_SA_INIT), before any group or user authentication. <ul style="list-style-type: none"> <li>– Pros—This option allows the master server to do minimal processing and state keeping (using CPU and memory) prior to redirecting the connection.</li> <li>– Cons—This option is not as secure as AUTH (even though security risks are minimal) because anyone can get a redirected IP address without authenticating at all.</li> </ul> </li> <li>• <b>AUTH</b> (the default)—Redirect during authentication (during IKE_AUTH). The device still has not identified or authenticated the user at this point, but it allows the client to authenticate the server to make sure it can trust the redirection that it receives. <ul style="list-style-type: none"> <li>– Pros—This option is more secure as the reply is encrypted in the IKEv2 tunnel and it allows the client side to authenticate the server before retrying with the redirected IP address, providing better DoS protection than the INIT option.</li> <li>– Cons—This option requires more processing as the IKEv2 tunnel needs to be almost brought up before redirecting, although child SAs and data tunnels do not need to be brought up. The client is not authenticated at all. Note that IKEv1 redirection occurs after group authentication of both sides of the tunnel.</li> </ul> </li> </ul> |

## Understanding NAT in VPNs

Network Address Translation (NAT) enables devices that use internal IP addresses to send and receive data through the Internet. It converts private, internal LAN addresses into globally routable IP addresses when they try to access data on the Internet. In this way, NAT enables a small number of public IP addresses to provide global connectivity for a large number of hosts.

NAT enhances the stability of your hub-and-spoke VPN tunnels or remote access connections because resources required for VPN connections are not used for other purposes, and the VPN tunnel is kept available for traffic requiring complete security. Sites inside the VPN can use NAT through a split tunnel to exchange non secure traffic with outside devices, and they do not squander VPN bandwidth or overwhelm the hub at the tunnel head-end by directing nonessential traffic through it.

Security Manager supports NAT with dynamic IP addressing only, and applies to it an overload feature that permits what is known as port-level NAT or Port Address Translation (PAT). PAT uses port addressing to associate thousands of private NAT addresses with a small group of public IP address. PAT is used if the addressing requirements of your network exceed the available addresses in your dynamic NAT pool.

**Note**

When you enable PAT on Cisco IOS routers, an additional NAT rule is implicitly created for split-tunneled traffic on deployment. This NAT rule, which denies VPN-tunneled traffic and permits all other traffic (using the external interface as the IP address pool), is not reflected as a router platform policy. You can remove the NAT rule by disabling this feature. For more information, see [NAT Page: Dynamic Rules, page 23-10](#).

You can configure traffic to bypass NAT configuration on site-to-site VPN traffic. To bypass NAT configuration on Cisco IOS routers, make sure the **Do Not Translate VPN Traffic** option is selected in the NAT Dynamic Rule platform policy (see [NAT Dynamic Rule Dialog Box, page 23-11](#)). To exclude NAT on PIX Firewalls or ASA devices, make sure this option is selected in the NAT Translation Options platform policy (see [Translation Options Page, page 23-15](#)).

**About NAT Traversal**

NAT traversal is used for the transmission of keepalive messages when there is a device (middle device) located between a VPN-connected hub and spoke, and that device performs NAT on the IPsec flow.

If the IP address of the VPN interface on the spoke is not globally routable, the NAT on the middle device replaces it with a new globally routable IP address. This change is made in the IPsec header, and violates the checksum of the spoke causing a mismatch with the hub's checksum calculation. This results in loss of connectivity between the hub and the spoke.

With NAT traversal, the spoke adds a UDP header to the payload. The NAT on the middle device changes the IP address in the UDP header, leaving the IPsec header and checksum intact. On a middle device that uses static NAT, you must provide the static NAT IP address (globally routable) on the inside interface. The static NAT IP address is provided for all traffic through that interface that requires NAT. However, if the middle device uses dynamic NAT where the NAT IP address is unknown, you must define dynamic crypto on the hub to serve any connection request from the spoke. Security Manager generates the required tunnel configuration for the spoke.

**Note**

NAT traversal is enabled by default on routers running IOS version 12.3T and later. If you want to disable the NAT traversal feature, you must do this manually on the device or using a FlexConfig (see [Chapter 7, "Managing FlexConfigs"](#)).

You can define global NAT settings on the NAT Settings tab of the Global VPN Settings page as described in [Configuring VPN Global NAT Settings, page 25-38](#).

## Configuring VPN Global NAT Settings

Use the NAT Settings tab of the Global Settings page to define global Network Address Translation (NAT) settings that enable devices that use internal IP addresses to send and receive data through the Internet.

**Note**

For site-to-site VPNs, if you want to bypass NAT configuration on IOS routers, make sure that the **Do Not Translate VPN Traffic** option is selected in the NAT Dynamic Rule platform policy (see [NAT Dynamic Rule Dialog Box, page 23-11](#)). To exclude NAT on PIX Firewalls or ASA devices, make sure this option is selected in the NAT Translation Options platform policy (see [Translation Options Page, page 23-15](#)).

**Navigation Path**

- For remote access VPNs, do one of the following:
  - (Device View) Select **Remote Access VPN > Global Settings** from the Policy selector. Click the **NAT Settings** tab.
  - (Policy View) Select **Remote Access VPN > Global Settings** from the Policy Type selector. Select an existing policy or create a new one, then click the **NAT Settings** tab.
- For site-to-site VPNs, do one of the following:
  - Open the [Site-to-Site VPN Manager Window, page 24-18](#), select a topology in the VPNs selector, then select **VPN Global Settings** in the Policies selector. Click the **NAT Settings** tab.
  - (Policy view) Select **Site-to-Site VPN > VPN Global Settings** from the Policy Types selector. Select an existing shared policy or create a new one, then click the **NAT Settings** tab.

| Enable PAT (Port Address Translation) on Split Tunneling for Spokes<br>(Site-to-site VPNs only.) | <p>Supported on Cisco IOS routers and Catalyst 6500/7600 devices.</p> <p>When selected, enables Port Address Translation (PAT) to be used for split-tunneled traffic on spokes in your VPN topology.</p> <p>PAT can associate thousands of private NAT addresses with a small group of public IP address through the use of port addressing. PAT is used if the addressing requirements of your network exceed the available addresses in your dynamic NAT pool.</p> <p><b>Note</b> When you select this option, Security Manager implicitly creates an additional NAT rule for split-tunneled traffic on deployment. This NAT rule, which denies VPN-tunneled traffic and permits all other traffic (using the external interface as the IP address pool), is not reflected as a router platform policy.</p> <p>For information on creating or editing a dynamic NAT rule as a router platform policy, see <a href="#">NAT Page: Dynamic Rules, page 23-10</a>.</p> |

## Configuring VPN Global General Settings

Use the General Settings tab of the VPN Global Settings page to define fragmentation settings including maximum transmission unit (MTU) handling parameters for site-to-site and remote access VPNs.

Fragmentation breaks a packet into smaller units when it is transmitted over a physical interface that cannot support the original size of the packet. Fragmentation minimizes packet loss in a VPN tunnel, because it enables transmission of secured packets that might otherwise be too large to transmit. This is particularly relevant when using GRE, because any packet of more than 1420 bytes will not have enough room in its header for the additional 80 bytes that the combined use of IPsec and GRE adds to the packet payload.

The maximum transmission unit (MTU) specifies the maximum packet size, in bytes, that an interface can handle. If a packet exceeds the MTU, it is fragmented, typically after encryption. If the DF (Do Not Fragment) bit is set, the packet is dropped. A DF bit is a bit within the IP header that indicates if a device can fragment a packet. You must specify whether the device can clear, set, or copy the DF bit from the encapsulated header.

Because reassembly of an encrypted packet is difficult, fragmentation can degrade network performance. To prevent network performance problems, you can select **Enable Fragmentation Before Encryption** so that fragmentation occurs before encryption.

### Navigation Path

- For remote access VPNs, do one of the following:
  - (Device View) Select **Remote Access VPN > Global Settings** from the Policy selector. Click the **General Settings** tab.
  - (Policy View) Select **Remote Access VPN > Global Settings** from the Policy Type selector. Select an existing policy or create a new one, then click the **General Settings** tab.
- For site-to-site VPNs, do one of the following:

- Open the [Site-to-Site VPN Manager Window, page 24-18](#), select a topology in the VPNs selector, then select **VPN Global Settings** in the Policies selector. Click the **General Settings** tab.
- (Policy view) Select **Site-to-Site VPN > VPN Global Settings** from the Policy Types selector. Select an existing shared policy or create a new one, then click the **General Settings** tab.

| <b>Fragmentation Settings</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Fragmentation Mode            | Supported on Cisco IOS routers and Catalyst 6500/7600 devices.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Local MTU Size                | <p>Fragmentation minimizes packet loss in a VPN tunnel when packets are transmitted over a physical interface that cannot support the original size of the packet. Select the fragmentation mode:</p> <ul style="list-style-type: none"> <li>• <b>No Fragmentation</b>—Do not fragment before IPsec encapsulation. After encapsulation, the device fragments packets that exceed the MTU setting before transmitting them through the public interface.</li> <li>• <b>End to End MTU Discovery</b>—Use ICMP messages to determine the maximum MTU. Use this option with IPsec VPNs.</li> </ul> <p>End-to-end MTU discovery uses Internet Control Message Protocol (ICMP) messages to determine the maximum MTU that a host can use to send a packet through the VPN tunnel without causing fragmentation. The MTU setting for each link in a transmission path is checked to ensure that no transmitted packet exceeds the smallest MTU in that path. The discovered MTU is used to decide whether fragmentation is necessary. If ICMP is blocked, MTU discovery fails and packets are either lost (if the DF bit is set) or fragmented after encryption (if the DF bit is not set).</p> <p><b>Note</b> (Site-to-site VPNs) For Catalyst 6500/7600 devices, end-to-end path MTU discovery is supported only on images 12.2(33)SRA, 12.2(33)SRB, 12.2(33)SXH, 12.2(33)SXI or above.</p> <ul style="list-style-type: none"> <li>• <b>Local MTU Handling</b>—Set the MTU locally on the devices. This option is typically used when ICMP is blocked or in site-to-site IPsec/GRE VPNs. If you select this option, specify the local MTU size, which can be between 68 and 65535 bytes depending on the VPN interface.</li> </ul> |

Table 25-8 VPN Global Settings Page, General Settings Tab (Continued)

| Element                                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DF Bit                                             | <p>Supported on Cisco IOS routers, Catalyst 6500/7600 devices, PIX 7.0+ and ASA devices.</p> <p>A Do Not Fragment (DF) bit within an IP header determines whether a device is allowed to fragment a packet. Select how to handle the DF bit:</p> <ul style="list-style-type: none"> <li>• <b>Copy</b>—Copy the DF bit from the encapsulated header in the current packet to all the device's packets. If the packet's DF bit is set to fragment, all future packets are fragmented. This is the default option.</li> <li>• <b>Set</b>—Set the DF bit in the packet you are sending. A large packet that exceeds the MTU is dropped and an ICMP message is sent to the packet's initiator.</li> <li>• <b>Clear</b>—Fragment packets regardless of the original DF bit setting. If ICMP is blocked, MTU discovery fails and packets are fragmented only after encryption.</li> </ul> |
| Enable Fragmentation Before Encryption             | <p>Supported on Cisco IOS routers, Catalyst 6500/7600 devices, PIX 7.0+ and ASA devices.</p> <p>When selected, enables fragmentation to occur before encryption if the expected packet size exceeds the MTU.</p> <p>Look ahead Fragmentation (LAF) is used before encryption takes place to calculate the packet size that would result after encryption, depending on the transform sets configured on the IPsec SA. If the packet size exceeds the specified MTU, the packet will be fragmented before encryption.</p>                                                                                                                                                                                                                                                                                                                                                           |
| Enable Notification on Disconnection               | <p>Supported on ASA and PIX 7.0+ devices.</p> <p>When selected, enables the device to notify qualified peers of sessions that are about to be disconnected. The peer receiving the alert decodes the reason and displays it in the event log or in a pop-up window. This feature is disabled by default.</p> <p>IPsec sessions might be dropped for several reasons, such as a security appliance shutdown or reboot, session idle timeout, maximum connection time exceeded, or administrator cut-off.</p>                                                                                                                                                                                                                                                                                                                                                                        |
| Enable Split Tunneling<br>(Site-to-site VPN only.) | <p>When selected (the default), enables you to configure split tunneling in your site-to-site VPN topology.</p> <p>Split tunneling allows you to transmit both secured and unsecured traffic on the same interface. Split tunneling requires that you specify exactly which traffic will be secured and what the destination of that traffic is, so that only the specified traffic enters the IPsec tunnel, while the rest is transmitted unencrypted across the public network.</p>                                                                                                                                                                                                                                                                                                                                                                                              |
| Enable Spoke-to-Spoke Connectivity through the Hub | <p>Supported on ASA and PIX 7.0+ devices.</p> <p>When selected, enables direct communication between spokes in a hub-and-spoke VPN topology in which the hub is an ASA or PIX 7.0+ device.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Element              | Description                                                                                                                                                                                |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Default Route | Supported on Cisco IOS routers and Catalyst 6500/7600 devices.<br>When selected, the device uses the configured external interface as the default outbound route for all incoming traffic. |

## Understanding IKEv1 Preshared Key Policies in Site-to-Site VPNs

If you want to use preshared key as your authentication method for IKEv1 negotiations, you must define a shared key for each tunnel between two peers that will be their shared secret for authenticating the connection. The key will be configured on each peer. If the key is not the same on both peers of the tunnel, the connection cannot be established. The peer addresses that are required for configuring the preshared key are deduced from the VPN topology.

**Tip**

You can also use preshared keys for IKEv2 negotiations, but the configuration is different from the one used for IKEv1, as are the rules and requirements. For information on configuring preshared keys for IKEv2 negotiations, see [Configuring IKEv2 Authentication in Site-to-Site VPNs, page 25-62](#).

Preshared keys are configured on spokes. In a hub-and-spoke VPN topology, Security Manager mirrors the spoke's preshared key and configures it on its assigned hub, so that the key on the spoke and hub are the same. In a point-to-point VPN topology, you must configure the same preshared key on both peers. In a full mesh VPN topology, any two devices that are connected must have the same preshared key.

In a preshared key policy, you can use a specific key, or you can use automatically generated keys for peers participating in each communication session. Using automatically generated keys (the default method) is preferred, because security can be compromised if all connections in a VPN use the same preshared key.

There are three methods for negotiating key information and setting up IKE security associations (SAs):

- Main mode address—Negotiation is based on IP address. Main mode provides the highest security because it has three two-way exchanges between the initiator and receiver. This is the default negotiation method.

This method has three options for creating keys:

- You can create a key for each peer, based on the unique IP address of each peer, providing high security.
- You can create a group preshared key on a hub in a hub-and-spoke VPN topology, to be used for communication with any device in a specified subnet. Each peer is identified by its subnet, even if the IP address of the device is unknown. In a point-to-point or full mesh VPN topology, a group preshared key is created on the peers.
- You can create a wildcard key on a hub in a hub-and-spoke VPN topology, or on a group containing hubs, to be used for dynamic crypto where a spoke does not have a fixed IP address or belong to a specific subnet. All spokes connecting to the hub have the same preshared key, which could compromise security. In a point-to-point or full mesh VPN topology, a wildcard key is created on the peers.

**Note** If you are configuring DMVPN with direct spoke-to-spoke connectivity, you create a wildcard key on the spokes.

- Main mode fully qualified domain name (FQDN)—Negotiation is based on DNS resolution, with no reliance on IP address. This option can only be used if the DNS resolution service is available for the host. It is useful when managing devices with dynamic IP addresses that have DNS resolution capabilities.
- Aggressive mode—Negotiation is based on hostname (without DNS resolution) and domain name. Aggressive mode is less secure than main mode. However, it provides more security than using group preshared keys if the IP address of the VPN interface on the host is unknown, and the FQDN of the dynamic IP peer is not DNS resolvable. This negotiation method is recommended for use with a GRE Dynamic IP or DMVPN failover and routing policy.

## Configuring IKEv1 Preshared Key Policies

Use the IKEv1 Preshared Key page to define the preshared key configuration when using IKEv1 in a site-to-site VPN topology. For information on configuring preshared keys when using IKEv2, see [Configuring IKEv2 Authentication in Site-to-Site VPNs, page 25-62](#).

**Note** The preshared key policy does not apply to Easy VPN topologies.

To open the IKEv1 Preshared Key page:

- ([Site-to-Site VPN Manager Window, page 24-18](#)) Select a topology in the VPNs selector, then select **IKEv1 Preshared Key** in the Policies selector.
- (Policy view) Select **Site-to-Site VPN > IKEv1 Preshared Key** from the Policy Types selector. Select an existing shared policy or create a new one.

The following table explains the settings you can configure in this policy.

**Table 25-9** *IKEv1 Preshared Key Page*

| Element                                                                                                                                                                             | Description                                                                                                                                                                       |

| Select whether to manually define the key (User Defined) or to have the key automatically generated. There are additional options you can configure when using auto generated keys. |                                                                                                                                                                                   |
| User Defined                                                                                                                                                                        | When selected, enables you to use a manually defined preshared key.<br>Enter the required preshared key in the <b>Key</b> field, then enter it again in the <b>Confirm</b> field. |

**Table 25-9** IKEv1 Preshared Key Page (Continued)

| Element                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Auto Generated                           | <p>When selected, allocates a random key to the participating peers. This ensures security because a different key is generated for every hub-spoke connection. Auto Generated is the default selection.</p> <p>Auto generated is not a useful option when you do not manage all nodes in the VPN, for example, in the case of an Extranet VPN.</p> <p><b>Note</b> The key is allocated during the first deployment to the devices and is used in all subsequent deployments to the same devices, until you select the Regenerate Key (Only in Next Deployment) check box.</p> |
| Key Length                               | The required length of the preshared key to be automatically generated, from 1 to 127. The default is 24.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Same Key for All Tunnels                 | <p>Unavailable in a point-to-point VPN topology.</p> <p>When selected, enables you to use the same auto-generated key for all tunnels.</p> <p><b>Note</b> If you do not select this option, different keys are used for the tunnels, except in cases, such as DMVPN configuration, when different multipoint GRE interfaces in the same network must use the same preshared key.</p>                                                                                                                                                                                           |
| Regenerate Key (Only in Next Deployment) | <p>When selected, enables Security Manager to generate a new key for the next deployment to the devices. This is useful if it is possible that the secrecy of the keys might be compromised.</p> <p>When you submit the job for deployment, this check box is cleared. It does not remain selected because the new key will only be generated for the upcoming deployment, and not for subsequent deployments (unless you select it again).</p>                                                                                                                                |

**Negotiation Method**

Select the type of negotiation method. The methods are explained in more detail in [Understanding IKEv1 Preshared Key Policies in Site-to-Site VPNs, page 25-43](#).

Table 25-9 IKEv1 Preshared Key Page (Continued)

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Main Mode Address | <p>Use this negotiation method for exchanging key information if the IP address of the devices is known. Negotiation is based on IP address. Main mode provides the highest security because it has three two-way exchanges between the initiator and receiver. Main mode address is the default negotiation method.</p> <p>Select one of the following options to define the negotiation address type:</p> <ul style="list-style-type: none"> <li>• <b>Peer Address</b>—Negotiation is based on the unique IP address of each peer. A key is created for each peer, providing high security. This is the default.</li> <li>• <b>Subnet</b>—Creates a group preshared key on a hub in a hub-and-spoke topology to use for communication with any device in a specified subnet, even if the IP address of the device is unknown. Each peer is identified by its subnet. In a point-to-point or full mesh VPN topology, a group preshared key is created on the peers. Enter the subnet in the field provided, for example, 10.10.10.0/24.</li> <li>• <b>Wildcard</b>—Creates a wildcard key on a hub or on a group of hubs in a hub-and-spoke topology to use when a spoke does not have a fixed IP address or belong to a specific subnet. In this case, all spokes connecting to the hub have the same preshared key, which could compromise security. Use this option if a spoke in your hub-and-spoke VPN topology has a dynamic IP address. In a point-to-point or full mesh VPN topology, a wildcard key is created on the peers.</li> </ul> <p><b>Note</b> When configuring DMVPN with direct spoke-to-spoke connectivity, you create a wildcard key on the spokes.</p> |
| Main Mode FQDN    | <p>Select this negotiation method for exchanging key information if the IP address is not known and DNS resolution is available for the devices. Negotiation is based on DNS resolution, with no reliance on IP address.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Aggressive Mode   | <p>Available only in a hub-and-spoke VPN topology.</p> <p>Select this negotiation method for exchanging key information if the IP address is not known and DNS resolution might not be available on the devices. Negotiation is based on hostname and domain name.</p> <p><b>Note</b> If direct spoke to spoke tunneling is enabled, you cannot use aggressive mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

# Understanding Public Key Infrastructure Policies

Security Manager supports IPsec configuration with Certification Authority (CA) servers that manage certificate requests and issue certificates to devices in your VPN topology. You can create a Public Key Infrastructure (PKI) policy to generate enrollment requests for CA certificates and RSA keys, and manage keys and certificates, providing centralized key management for the participating devices.

CA servers, also known as trustpoints, manage public CA certificate requests and issue certificates to participating IPsec network devices. When you use Certificates as the authentication method for IKE and IPsec proposal policies, peers are configured to obtain digital certificates from a CA server. With a CA server, you do not have to configure keys between all the encrypting devices. Instead, you individually enroll each participating device with the CA server, which is explicitly trusted to validate identities and create a digital certificate for the device. When this has been accomplished, each participating peer can validate the identities of the other participating peers and establish encrypted sessions with the public keys contained in the certificates.

CAs can also revoke certificates for peers that no longer participate in an IPsec VPN topology. Revoked certificates are either managed by an Online Certificate Status Protocol (OCSP) server or are listed in a certificate revocation list (CRL) stored on an LDAP server, which each peer can check before accepting a certificate from another peer.

PKI enrollment can be set up in a hierarchical framework consisting of multiple CAs. At the top of the hierarchy is a root CA, which holds a self-signed certificate. The trust within the entire hierarchy is derived from the RSA key pair of the root CA. Subordinate CAs within the hierarchy can enroll with either the root CA or with another subordinate CA. Within a hierarchical PKI, all enrolled peers can validate each other's certificate if the peers share a trusted root CA certificate or a common subordinate CA.

Keep the following in mind:

- PKI policies can be configured on Cisco IOS routers running version 12.3(7)T and later, PIX Firewalls, and Adaptive Security Appliance (ASA) devices for site-to-site and remote access VPNs.
- In site-to-site VPNs, you use the IKEv1 Public Key Infrastructure policy to identify CA servers for IKEv1 negotiations only. For IKEv2 negotiations, you identify the CA servers in the IKEv2 Authentication policy as described in [Configuring IKEv2 Authentication in Site-to-Site VPNs, page 25-62](#).
- To save the RSA key pairs and the CA certificates between reloads permanently to Flash memory on a PIX Firewall release 6.3, you must configure the **ca save all** command. You can do this manually on the device or using a FlexConfig (see [Chapter 7, “Managing FlexConfigs”](#)).

## CA Server Authentication Methods

You can authenticate the CA server using one of the following methods:

- Using the Simple Certificate Enrollment Protocol (SCEP) to retrieve the CA's certificates from the CA server. Using SCEP, you establish a direct connection between your device and the CA server. Be sure your device is connected to the CA server before beginning the enrollment process. Because this method of retrieving CA certificates for routers is interactive, you can deploy your PKI policy to live devices only, not to files.

### Note

When using SCEP, you must enter the fingerprint for the CA server. If the value you enter does not match the fingerprint on the certificate, the certificate is rejected. You can obtain the CA's fingerprint by contacting the server directly, or by entering the following address in a web browser: **http://<URLHostName>/certsrv/mscep/mscep.dll**.

- Manually creating an enrollment request that you can submit to a CA server offline, by copying the CA server's certificates from another device.

Use this method if your device cannot establish a direct connection to the CA server or if you want to generate an enrollment request and send it to the server at a later time.

---

**Note** This method enables you to deploy the PKI policy either to devices or to files.

---

For more information, see [PKI Enrollment Dialog Box, page 25-54](#).

**Note**

---

You can also use Cisco Secure Device Provisioning (SDP) to enroll for a certificate for a router. For more information about using SDP for certificate enrollment, see [Secure Device Provisioning on Cisco IOS Routers, page 60-81](#).

---

The following topics explain Public Key Infrastructure configuration in more detail:

- [Requirements for Successful PKI Enrollment, page 25-48](#)
- [Configuring IKEv1 Public Key Infrastructure Policies in Site-to-Site VPNs, page 25-50](#)
- [Defining Multiple IKEv1 CA Servers for Site-to-Site VPNs, page 25-51](#)
- [Configuring Public Key Infrastructure Policies for Remote Access VPNs, page 25-52](#)
- [PKI Enrollment Dialog Box, page 25-54](#)

## Requirements for Successful PKI Enrollment

The following are prerequisites for configuring a PKI policy in your network:

- For IKEv1, the IKE proposal must specify Certificate for the IKE authentication method. See [Configuring IKEv1 Proposal Policy Objects, page 25-10](#).
- The domain name must be defined on the devices for PKI enrollment to be successful (unless you specify the CA server nickname).
- To enroll with the CA server directly, you must specify the server's enrollment URL.
- To enroll with the CA server by means of a TFTP server, you must ensure that the CA certificates file is saved to the TFTP server. After deployment of the PKI policy, you must copy the certificate request from your TFTP server to the CA server.
- You may specify an RSA public key to use in the enrollment request. If you do not specify an RSA key pair, the Fully Qualified domain Name (FQDN) key will be used.

If using RSA keys, once the certificate has been granted, the public key is included in the certificate so that peers can use it to encrypt data sent to the device. The private key is kept on the device and used to decrypt data sent by peers, and to digitally sign transactions when negotiating with peers. You can use an existing key pair or generate a new one. If you want to generate a new key pair to use in the certificate for router devices, you must also specify the modulus to determine the size of the key.

For more information, see [PKI Enrollment Dialog Box—Enrollment Parameters Tab, page 25-59](#).

- If you are making a PKI enrollment request on a Cisco Easy VPN IPsec remote access system, you must configure each remote component (spoke) with the name of the user group to which it connects. You specify this information in the Organization Unit (OU) field in the Certificate Subject Name tab of the PKI Enrollment Editor dialog box.

**Note** You do not need to configure the name of the user group on the hub (Easy VPN server).

For more information, see [PKI Enrollment Dialog Box—Certificate Subject Name Tab, page 25-61](#).

- To deploy PKI policies to files (not to live devices), the following prerequisites must be met:
  - Routers must run Cisco IOS Software 12.3(7)T or later.
  - CA authentication certificates must be cut and pasted into the Security Manager user interface (so that CA authentication is not interactive and does not require communication with the live device).
- If you are deploying to live devices, the PKI server must be online.
- Security Manager supports the Microsoft, Verisign, and Entrust PKIs.
- Security Manager supports Cisco IOS Certificate Servers. The Cisco IOS Certificate Server feature embeds a simple certificate server, with limited CA functionality, into the Cisco IOS software. An IOS Certificate Server can be configured as a FlexConfig policy. For more information, see [Chapter 7, “Managing FlexConfigs”](#).
- To configure PKI with AAA authorization that uses the entire subject name on an IOS router, use the predefined FlexConfig object named IOS\_PKI\_WITH\_AAA.

#### Prerequisites for PKI Enrollment Using TFTP

If you do not have constant direct access to the CA server, you can enroll using TFTP if your devices are routers running Cisco IOS Software 12.3(7)T or later.

On deployment, Security Manager generates the corresponding CA trustpoint command and authenticate command. The trustpoint command is configured with the enrollment URL `tftp://<certserver><file_specification>` entry to retrieve the CA certificate using TFTP. If `file_specification` is not specified, the FQDN of the router is used.

Before using this option, you must make sure that the CA certificates file (.ca) is saved on the TFTP server. To do this, use this procedure:

1. Connect to `http://servername/certsrv`, where `servername` is the name of the Windows 2000 web server on which the CA you want to access is located.
2. Select **Retrieve the CA certificate or certificate revocation list**, then click **Next**.
3. Select **Base64 encoded**, then click **Download CA certificate**.
4. Save the .crt file as a .ca file on the TFTP server using your browser’s Save As function.

After deployment, you must transfer the certificate request generated by Security Manager on the TFTP server to the CA, and then transfer the device’s certificates from the CA to the device.

#### Transferring the Certificate Request from the TFTP Server to the CA Server

Security Manager creates a PKCS#10 formatted enrollment request (.req) on the TFTP server. You must transfer it to the PKI server using this procedure:

1. Connect to `http://servername/certsrv`, where `servername` is the name of the Windows 2000 web server where the CA you want to access is located.
2. Select **Request a certificate**, then click **Next**.
3. Select **Advanced request**, then click **Next**.
4. Select **Submit a certificate request using a base64 encoded PKCS #10 file or a renewal request using a base64 encoded PKCS #7 file**, then click **Next**.

5. Either select browse for a file (and browse to the TFTP server and select the .req file) or open the just received by TFTP .req file with WordPad/Notepad and copy/paste the contents in the first window.
6. Export the .crt file from the CA and put it on the TFTP server.
7. Configure the 'crypto ca import <label> certificate' to import the device's certificates from the tftp server.

## Configuring IKEv1 Public Key Infrastructure Policies in Site-to-Site VPNs

You can create a Public Key Infrastructure (PKI) policy to generate enrollment requests for CA certificates and RSA keys, and to manage keys and certificates. Certification Authority (CA) servers are used to manage these certificate requests and issue certificates to the participating devices in your VPN topology.

In Security Manager, CA servers are predefined as PKI enrollment objects that you can use in your PKI policies. A PKI enrollment object contains the server information and enrollment parameters that are required for creating enrollment requests for CA certificates.

For more information about Public Key Infrastructure policies, see [Understanding Public Key Infrastructure Policies, page 25-47](#).

This procedure describes how to specify the CA server that will be used to create an IKEv1 Public Key Infrastructure (PKI) policy in your VPN topology.

**Tip**

For information on specifying CA servers for use in IKEv2 negotiations, see [Configuring IKEv2 Authentication in Site-to-Site VPNs, page 25-62](#).

#### Before You Begin

For important information about successfully configuring PKI, see [Requirements for Successful PKI Enrollment, page 25-48](#).

#### Related Topics

- [Defining Multiple IKEv1 CA Servers for Site-to-Site VPNs, page 25-51](#)
- [Deciding Which Authentication Method to Use, page 25-8](#)
- [Filtering Items in Selectors, page 1-42](#)

**Step 1** Do one of the following:

- ([Site-to-Site VPN Manager Window](#)) Select an existing topology and then select **IKEv1 Public Key Infrastructure** in the Policies selector.
- (Policy view) Select **Site-to-Site VPN > IKEv1 Public Key Infrastructure**, and then select an existing policy or create a new one.

The Public Key Infrastructure page opens, displaying the currently selected CA server, if any, in the **Selected** field.

**Step 2** Select the PKI enrollment policy object that defines the desired CA server in the Available CA Servers list. You can do the following to modify the listed objects:

- To add a new PKI enrollment object, click the **Create (+)** button. The Add PKI Enrollment dialog box opens. For detailed information about the attributes of a PKI enrollment object, see [PKI Enrollment Dialog Box, page 25-54](#).
- To change the configuration of an existing object, select it and click the **Edit (pencil)** button.

**Note** If you are making a PKI enrollment request on an Easy VPN topology, you must configure each remote component (spoke) with the name of the user group to which it connects. You specify this information in the Organization Unit (OU) field in the Certificate Subject Name tab of the PKI Enrollment dialog box. You do not need to configure the name of the user group on the hub (Easy VPN server). For more information, see [PKI Enrollment Dialog Box—Certificate Subject Name Tab, page 25-61](#).

## Defining Multiple IKEv1 CA Servers for Site-to-Site VPNs

You can select only one CA server when defining an IKEv1 Public Key Infrastructure (PKI) policy on a site-to-site VPN. This creates a problem when the devices in the VPN enroll with different CA servers when using IKEv1. For example, the spoke devices might enroll with a different CA server than the hub, or the spokes in one part of the VPN might enroll with a different CA server than the spokes in another part of the VPN.

**Tip**

When using IKEv2, you can configure different CA servers for various devices by creating overrides for the IKEv2 Authentication policy global settings rather than creating device-level overrides for PKI enrollment policy objects. However, you can also use device-level overrides for IKEv2 as described in this topic. For information on configuring CA servers for IKEv2, see [Configuring IKEv2 Authentication in Site-to-Site VPNs, page 25-62](#).

To define an IKEv1 PKI policy, you select a PKI enrollment object that specifies the CA server to which the devices should enroll. Although by default the policy object refers globally to a single CA server, you can use device-level overrides to have the object refer to a different CA server on selected devices.

For example, if PKI enrollment object PKI\_1 refers to a CA server named CA\_1, you can create a device-level override for selected devices that has PKI\_1 refer to a different CA server, for example, CA\_2. Theoretically, you can use overrides to define a different CA server for each device in the VPN.

This procedure describes the basic steps for creating overrides for PKI enrollment objects.

**Note**

You can also use device-level overrides when the CA servers are arranged in a PKI hierarchy beneath a common, trusted CA server. To do this, you must ensure that both the global definition of the object and the device-level override specify the trusted CA server in the Trusted CA Hierarchy tab of the PKI Enrollment dialog box. See [PKI Enrollment Dialog Box—Trusted CA Hierarchy Tab, page 25-62](#).

**Related Topics**

- [Understanding Public Key Infrastructure Policies, page 25-47](#)
- [Deciding Which Authentication Method to Use, page 25-8](#)

- 
- Step 1** To create the PKI enrollment object, open the PKI Enrollment dialog box. You can access this dialog box in two ways:
- From the Public Key Infrastructure policy—Click the **Create (+)** button beneath the Selected field. See [Configuring IKEv1 Public Key Infrastructure Policies in Site-to-Site VPNs, page 25-50](#).
  - From the Policy Object Manager (select **Manage > Policy Objects**)—Select PKI Enrollments from the Object Type selector, then click the **New Object (+)** button.
- Step 2** Define the global definition of the PKI enrollment object, including the CA server to which the object refers. Be sure to select **Allow Value Override per Device**. This option makes the object overridable on individual devices. See [PKI Enrollment Dialog Box, page 25-54](#).
- Base the global definition of the object on the CA server that is used by the most devices in the VPN. Doing this reduces the number of device-level overrides that are required.
- Step 3** When you finish defining the PKI enrollment object, click **OK**. As a result:
- If you accessed the dialog box through the PKI policy, the new object appears in the Selected field of the policy page.
  - If you accessed the dialog box using the Policy Object Manager, the new object appears in the work area of the Policy Object Manager window. A green check mark in the Overridable column indicates that device-level overrides can be created for this object. (The check mark does not indicate whether any overrides actually exist.)
- Step 4** Create the device-level overrides for the PKI enrollment object. You can do this in one of two ways:
- From Device Properties (with the device selected in Device view, select **Tools > Device Properties**)—This option is recommended when you want to create a device-level override for a single device. In the device properties, select **Policy Object Overrides > PKI Enrollments**, select the PKI enrollment object that you want to override, then click the **Create Override** button. You can then define the content of the override, including the CA server defined by the object.  
For more information, see [Creating or Editing Object Overrides for a Single Device, page 6-18](#).
  - From the Policy Object Manager—This option is recommended when you want to create a device-level override for multiple devices at the same time. Double-click the green check mark in the Overridable column, select the devices to which the override should apply, then define the content of the override, including the CA server defined by the object.  
For more information, see [Creating or Editing Object Overrides for Multiple Devices At A Time, page 6-19](#).

## Configuring Public Key Infrastructure Policies for Remote Access VPNs

You can create a Public Key Infrastructure (PKI) policy to generate enrollment requests for CA certificates and RSA keys, and to manage keys and certificates. Certification Authority (CA) servers are used to manage these certificate requests and issue certificates to users who connect to your IPsec or SSL remote access VPN.

In Security Manager, CA servers are predefined as PKI enrollment objects that you can use in your PKI policies. A PKI enrollment object contains the server information and enrollment parameters that are required for creating enrollment requests for CA certificates.

For more information about Public Key Infrastructure policies, see [Understanding Public Key Infrastructure Policies, page 25-47](#).

This procedure describes how to specify the CA servers that will be used to create a Public Key Infrastructure (PKI) policy in your remote access VPN.

### Before You Begin

Keep the following in mind:

- For important information about successfully configuring PKI, see [Requirements for Successful PKI Enrollment, page 25-48](#).
- The **IKE Proposal** policy for IPsec remote access VPNs should use an IKE Proposal object that requires certificate authorization when configuring IKEv1.
- For remote access VPNs defined on an ASA or PIX 7.x+ device, be aware that the Public Key Infrastructure policy is directly related to the following policies. Any trustpoints defined in these policies must also be selected in the Public Key Infrastructure policy; they are not automatically added to the policy. You might want to first configure these policies to determine which PKI enrollment objects are required in your remote access VPNs.
  - **Connection Profiles**—When you create a IPsec connection profile for which CA trustpoints should be used, you select the PKI enrollment object that identifies the trustpoint on the IPsec tab.
  - **SSL VPN Access**—You can configure trustpoints for each interface and also a fallback trustpoint.
  - **Global Settings, IKEv2 Settings tab**—For IKEv2 IPsec, you must specify a global trustpoint.

### Related Topics

- [Deciding Which Authentication Method to Use, page 25-8](#)
- [Filtering Items in Selectors, page 1-42](#)

- 
- Step 1** Do one of the following:
- (Device view) Select **Remote Access VPN > Public Key Infrastructure** from the Policy selector.
  - (Policy view) Select **Remote Access VPN > Public Key Infrastructure** from the Policy Type selector. Select an existing policy or create a new one.

The Public Key Infrastructure page opens, displaying the currently available and selected CA servers (PKI enrollment objects), if any.

- Step 2** Select the PKI enrollment policy objects that define the desired CA servers in the Available CA Servers list and click >> to move them to the Selected CA Servers list. You can remove undesired objects by selecting them in the selected list and clicking <<.

For ASA and PIX 7.x+ devices, the list of selected PKI enrollment objects must include all objects that are specified in the connection profiles defined for the remote access VPN. For more information on connection profiles, see [Configuring Connection Profiles \(ASA, PIX 7.0+\), page 30-6](#). Also, any trustpoints configured for IKEv2 on the Global Settings policy must be included; see [Configuring VPN Global IKEv2 Settings, page 25-34](#).

You can do the following to modify the listed objects:

- To add a new PKI enrollment object, click the **Create (+)** button below the list of available servers. The Add PKI Enrollment dialog box opens. For detailed information about the attributes of a PKI enrollment object, see [PKI Enrollment Dialog Box, page 25-54](#).
- To change the configuration of an existing object, select it in either list and click the **Edit (pencil)** button.

## PKI Enrollment Dialog Box

Use the PKI Enrollment dialog box to view, create, copy, or edit Public-Key Infrastructure (PKI) enrollment objects. A PKI enrollment object represents an external certification authority (CA) server that responds to certificate requests from devices in the network.

You can create PKI enrollment objects to define the properties of a CA server used when devices exchange certificates as part of an IPsec network. When you create a PKI enrollment object, you define a name for the server and the URL for enrollment. You must specify whether the devices you wish to enroll with this server should retrieve the CA server's own certificate using the Simple Certificate Enrollment Process (SCEP) or use a certificate that you have entered manually into the device configuration. You must also select the method of support used by the CA server for revocation checking.

### Note

You do not have to define enrollment parameters in order to create or import a trustpoint in Security Manager.

In addition, you can optionally define the following:

- Whether the CA server is acting as a Registration Authority (RA) server.
- Enrollment parameters, including retry settings and RSA key pair settings.
- Additional attributes to include in the certificate request.
- The list of trusted CA servers located above this server in the PKI hierarchy.

### Navigation Path

Select **Manage > Policy Objects**, then select **PKI Enrollments** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

### Tip

You can also open this dialog box from the **Public Key Infrastructure** policy for remote access or site-to-site VPNs.

| Category                        | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects, page 6-12</a> .                                                                                                                                                                   |
| Allow Value Override per Device | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden, page 6-18</a> and <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-17</a> .                                                      |
| Overrides                       |                                                                                                                                                                                                                                                                                                                             |
| Edit button                     | If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.                                                                                                                |

**PKI Enrollment Dialog Box—CA Information Tab**

Use the CA Information tab of the PKI Enrollment dialog box to:

- Define the name and location of the external certificate authority (CA) server.
- Manually paste the certificate, if known.
- Define the server's level of support for revocation checking.

**Navigation Path**

Go to the PKI Enrollment dialog box and click the **CA Information** tab. For information on opening the dialog box, see [PKI Enrollment Dialog Box, page 25-54](#).

| Revocation Check Support                     | <p>The type of certificate revocation checking to be performed:</p> <ul style="list-style-type: none"> <li>• <b>Checking Not Performed</b>—This is the default. The device does not perform any revocation checking, even if a CRL is on the device.</li> <li>• <b>CRL Check Required</b>—The device must check a CRL. If no CRL exists on the device and the device cannot obtain one, certificates are rejected and a tunnel cannot be established.</li> <li>• <b>OCSP Check Required</b>—The device must check revocation status from an OCSP server. If this check fails, certificates are rejected.</li> <li>• <b>CRL Check Attempted</b>—The device tries to download the latest CRL from the specified LDAP server. If the download fails, however, certificates are accepted.</li> <li>• <b>OCSP Check Attempted</b>—The device tries to check revocation status from an OCSP server. If this fails, however, certificates are accepted.</li> <li>• <b>CRL or OCSP Check Required</b>—The device first checks for a CRL. If a CRL does not exist or cannot be obtained, the device tries to check revocation status from an OCSP server. If both options fail, certificates are rejected.</li> <li>• <b>OCSP or CRL Check Required</b>—The device first tries to check revocation status from an OCSP server. If this fails, the device checks for a CRL. If both options fail, certificates are rejected.</li> <li>• <b>CRL and OCSP Checks Attempted</b>—The device first checks for a CRL. If a CRL does not exist or cannot be obtained, the device tries to check revocation status from an OCSP server. If both options fail, however, certificates are accepted.</li> <li>• <b>OCSP and CRL Checks Attempted</b>—The device first tries to check revocation status from an OCSP server. If this fails, the device tries to download the latest CRL. If both options fail, however, certificates are accepted.</li> </ul> |
| OCSP Server URL                              | The URL of the OCSP server checking for revocation if you require OCSP checks. This URL must start with <b>http://</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| CRL Server URL                               | <p>The URL of the LDAP server from which the CRL can be downloaded if you require CRL checks. This URL must start with <b>ldap://</b></p> <p><b>Note</b> You must include a port number in the URL when using this AAA server on ASA devices, otherwise LDAP will fail.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Enable Registration Authority Mode (PIX 6.3) | <p>For PIX 6.3 devices, whether the CA server operates in RA (Registration Authority) mode. A Registration Authority is a server that acts as a proxy for the actual CA so that CA operations can continue when the CA server is offline.</p> <p><b>Note</b> Cisco IOS routers configure RA mode automatically, if required.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## PKI Enrollment Dialog Box—Enrollment Parameters Tab

Use the Enrollment Parameters tab of the PKI Enrollment dialog box to define the retry settings to use when the device contacts the CA server as well as the settings for generating the RSA key pair to associate with the certificate.

If the PKI enrollment object represents a Microsoft CA, you can define the challenge password required to validate the router's identity.

### Note

You do not have to define enrollment parameters in order to create or import a trustpoint in Security Manager.

### Navigation Path

Go to the PKI Enrollment dialog box and click the **Enrollment Parameters** tab. For information on opening the dialog box, see [PKI Enrollment Dialog Box, page 25-54](#).

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Challenge Password | <p>The password used by the CA server to validate the identity of the device. This password is mandatory for PIX 6.3 devices, but optional for PIX/ASA 7.0+ devices and Cisco IOS routers.</p> <p>You can obtain the password by contacting the CA server directly or by entering the following address in a web browser:<br/> <b>http://URLHostName/certsrv/msecp/msecp.dll</b>. The password is good for 60 minutes from the time you obtain it from the CA server. Therefore, it is important that you deploy the password as soon as possible after you create it.</p> <p><b>Note</b> Each password is valid for a single enrollment by a single device. Therefore, we do not recommend that you assign a PKI enrollment object where this field is defined to a VPN, unless you first configure a device-level override for each device in the VPN. For more information, see <a href="#">Understanding Policy Object Overrides for Individual Devices, page 6-17</a>.</p> |
| Retry Period       | The interval between certificate request attempts, in minutes. Values can be 1 to 60 minutes. The default is 1 minute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Retry Count        | The number of retries that should be made if no certificate is issued upon the first request. Values can be 1 to 100. The default is 10.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

Table 25-12 PKI Enrollment Dialog Box—Enrollment Parameters Tab (Continued)

| Element                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Certificate Auto-Enrollment<br>(IOS devices only.)      | <p>The percentage of the current certificate's lifetime after which the router requests a new certificate. For example, if you enter 70, the router requests a new certificate after 70% of the lifetime of the current certificate has been reached. Values range from 10% to 100%.</p> <p>If you do not specify a value, the router requests a new certificate after the old certificate expires.</p>                                                                                                                                                                                                                    |
| Include Device's Serial Number                          | <p>Whether to include the serial number of the device in the certificate.</p> <p><b>Tip</b> The CA uses the serial number to either authenticate certificates or to later associate a certificate with a particular device. If you are in doubt, include the serial number, as it is useful for debugging purposes.</p>                                                                                                                                                                                                                                                                                                    |
| RSA Key Pair Name<br>(PIX 7.0+, ASA, IOS devices only.) | <p>If the key pair you want to associate with the certificate already exists, this field specifies the name of that key pair.</p> <p>If the key pair does not exist, this field specifies the name to assign to the key pair that will be generated during enrollment.</p> <p><b>Note</b> If you do not specify an RSA key pair, the fully qualified domain name (FQDN) key pair is used instead. On PIX and ASA devices, the key pair must exist on the device before deployment.</p>                                                                                                                                     |
| RSA Key Size<br>(IOS devices only.)                     | <p>If the key pair does not exist, defines the desired key size (modulus), in bits. If you want a modulus between 512 and 1024, enter an integer that is a multiple of 64. If you want a value higher than 1024, enter 1536 or 2048. The recommended size is 1024.</p> <p><b>Note</b> The larger the modulus size, the more secure the key. However, keys with larger modulus sizes take longer to generate (a minute or more when larger than 512 bits) and longer to process when exchanged.</p>                                                                                                                         |
| RSA Encryption Key Size<br>(IOS devices only.)          | <p>The size of the second key, which is used to request separate encryption, signature keys, and certificates.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Source Interface<br>(IOS devices only.)                 | <p>The source address for all outgoing connections sent to a CA or LDAP server during authentication, enrollment, and when obtaining a revocation list. This parameter may be necessary when the CA server or LDAP server cannot respond to the address from which the connection originated (for example, due to a firewall).</p> <p>If you do not define a value in this field, the address of the outgoing interface is used.</p> <p>Enter the name of an interface or interface role, or click <b>Select</b> to select it. If the object that you want is not listed, click the <b>Create</b> button to create it.</p> |

## PKI Enrollment Dialog Box—Certificate Subject Name Tab

Use the Certificate Subject Name tab of the PKI Enrollment dialog box to optionally define additional information about the device in certificate requests sent to the CA server. This information is placed in the certificate and can be viewed by any party who receives the certificate from the router.

Enter all information using the standard LDAP X.500 format.

### Navigation Path

Go to the PKI Enrollment dialog box and click the **Certificate Subject Name** tab. For information on opening the dialog box, see [PKI Enrollment Dialog Box, page 25-54](#).

| Email (E) | The email address to include in the certificate. |

## PKI Enrollment Dialog Box—Trusted CA Hierarchy Tab

Use the Trusted CA Hierarchy tab of the PKI Enrollment dialog box to define the trusted CA servers within an hierarchical PKI framework. Within this framework, all enrolled peers can validate each other's certificates if they share a trusted root CA certificate or a common subordinate CA.

Select the CA servers (as defined as PKI enrollment objects) to include in the hierarchy in the Available Servers list and click >> to move them to the selected list. You can do the reverse to remove servers.

If the PKI enrollment object you need is not yet defined, click the **Create (+)** button beneath the available servers list to create the object. You can also select an object and click the **Edit** button to change its definition, if needed.

### Navigation Path

Go to the PKI Enrollment dialog box and click the **Trusted CA Hierarchy** tab. For information on opening the dialog box, see [PKI Enrollment Dialog Box, page 25-54](#).

# Configuring IKEv2 Authentication in Site-to-Site VPNs

When you configure IKE version 2 (IKEv2) in a site-to-site VPN, you must configure the IKEv2 Authentication policy to define authentication settings. Unlike IKEv1, authentication settings are not part of the IKEv2 proposal.

In Security Manager, when you configure IKEv2 authentication for a site-to-site VPN, you configure default settings that will be used in the VPN topology. You can then configure exceptions to the default, specifying different preshared keys or trustpoints for specific segments of the VPN. You can use a mixture of preshared keys and trustpoints, for example, configuring a global preshared key, but trustpoints for selected members of the VPN.

IKEv2 allows you to use asymmetric authentication, unlike IKEv1. This means that two peers can have different preshared keys, different trustpoints, or one peer could use a preshared key and the other peer could use a trustpoint. In Security Manager, you can configure asymmetric authentication by doing any of the following:

- On the Global IKEv2 Authentication Settings tab, you can configure different preshared keys if you elect to auto-generate keys and **do not** select the Same Keys for All Tunnels or the Same Key at Tunnel Endpoints option. A different preshared key is generated for each end of each tunnel.
- On the Override IKEv2 Authentication Settings tab, you can create overrides for the global settings. You add overrides that specify different keys or trustpoints for subsets of local and remote peers. Because you can create more than one override for a device or a specific tunnel, you can configure a set of preshared keys and trustpoints from which peers will authenticate.

**Tip**

The IKEv2 Authentication policy is not a shared policy. You must configure the policy for each VPN topology in which you support IKEv2 negotiations. You cannot configure global IKEv2 authentication options for use by all of your VPN topologies. When using the Create VPN wizard, even if you elect to support IKEv2, the IKEv2 Authentication policy is never configured.

**Before You Begin**

The IKEv2 Authentication policy is used only if you enable IKEv2 in the VPN in the IKE Proposal and IPsec Proposal policies, and if at least some of the devices in the topology support IKEv2.

To configure IKEv2, the device must be an ASA running ASA Software release 8.4(1) or higher. For more information on device support, see [Understanding Devices Supported by Each IPsec Technology](#), page 24-9.

**Tip**

If you support only IKEv2 in the topology, ensure that you unassign the IKEv1 Preshared Keys and IKEv1 Public Key Infrastructure policies to avoid validation warnings.

**Related Topics**

- [Understanding IKE](#), page 25-5
- [Deciding Which Authentication Method to Use](#), page 25-8

**Step 1** Open the [Site-to-Site VPN Manager Window](#), page 24-18, select a regular IPsec topology (that supports IKEv2) in the VPNs selector, then select **IKEv2 Authentication** in the Policies selector.

For reference information on the policy, see [IKEv2 Authentication Policy](#), page 25-64.

**Step 2** On the **Global IKEv2 Authentication Settings** tab, configure the authentication type that should be used for devices in the VPN for which no override is configured on the Override IKEv2 Authentication Settings tab. Select the option that is used by most devices in the VPN. You can configure a global preshared key or trustpoint:

- **Global Preshared Keys**—To configure a global preshared key, select **Key Specification** and then configure one of the following options:
  - **User Defined**—Enter the desired global key and enter it again in the Confirm field.
  - **Auto Generated**—Enter the length of the key that should be generated and select whether you want to use the same key for all tunnels or the same key at both ends of a single tunnel. If you select neither of these options, unique keys are generated for every end point.
 

You can also select **Regenerate Key (On Next Deployment)** to have new keys generated. This allows you to periodically re-key the VPN. The check box is cleared after the next successful deployment.
- **Global Trustpoint (CA Servers)**—To configure trustpoint certificate authorization, select **PKI Specification** and enter the name of the PKI enrollment object that identifies the Certificate Authority (CA) server. Click **Select** to select the object from a list or to create a new object.

**Step 3** If you want to override the global IKEv2 authentication configuration for specific devices, click the **Override IKEv2 Authentication Settings** tab and do any of the following:

- To add an override, click the **Add Row (+)** button and fill in the IKEv2 Authentication dialog box. You select the local and remote peers for which to create the override, and then specify the preshared key or CA server that should be used. See [IKEv2 Authentication \(Override\) Dialog Box](#), page 25-66.
- To edit an override, select it in the table and click the **Edit Row (pencil)** button.

- To delete an override, select it in the table and click the **Delete Row (trash can)** button.
- 

## IKEv2 Authentication Policy

Use the IKEv2 Authentication policy to configure the device authentication settings for Internet Key Exchange (IKE) version 2 in site-to-site VPNs. These settings apply to ASA 8.4(1)+ devices only. For more information about configuring IKEv2 authentication, see [Configuring IKEv2 Authentication in Site-to-Site VPNs, page 25-62](#).

The policy contains two tabs:

- **Global IKEv2 Authentication Settings**—The global settings apply to all devices in the VPN unless overrides are configured on the Overrides tab. Configure the global settings to represent the authentication scheme used by most devices in the VPN.
- **Override IKEv2 Authentication Settings**—The override settings apply unique authentication settings to specific tunnels, allowing you to create unique preshared key and trustpoint combinations that are required by various tunnels in the VPN. The settings you configure on this tab are used first and always take precedence over the global settings.

### Navigation Path

Open the [Site-to-Site VPN Manager Window, page 24-18](#), select a regular IPsec topology (that supports IKEv2) in the VPNs selector, then select **IKEv2 Authentication** in the Policies selector.

This policy is not available as a shared policy.

# CHAPTER 26

## GRE and DM VPNs

---

You can configure Generic Routing Encapsulation (GRE) and Dynamic Multipoint (DM) VPNs that include GRE mode configurations. You can configure IPsec GRE VPNs for hub-and-spoke, point-to-point, and full mesh VPN topologies. DMVPN is available for hub-and-spoke topologies only.

This chapter contains the following topics:

- [Understanding the GRE Modes Page, page 26-1](#)
- [GRE and Dynamic GRE VPNs, page 26-2](#)
- [Dynamic Multipoint VPNs \(DMVPN\), page 26-9](#)

### Understanding the GRE Modes Page

Use the GRE Modes page to define the routing and tunnel parameters for IPsec tunneling with GRE, GRE Dynamic IP, and DMVPN policies.

The content of the policy differs depending on how you access it:

- ([Site-to-Site VPN Manager Window, page 24-18](#)) When you select a GRE VPN or DMVPN, the GRE Modes policy contains the properties related to the technology and technology type used in the VPN.
- (Policy view) When you select **Site-to-Site VPN > GRE Modes**, and create a new policy or select an existing policy, there is an additional field in the policy called **GRE Method**. From the GRE Method list, you must select the VPN technology and technology type for which you are defining the policy: IPsec/GRE, GRE Dynamic IP, DMVPN, or Large Scale DMVPN. This option controls which fields are displayed in the policy. You cannot change the GRE Method after you save the policy.

When you assign a shared GRE Modes policy to a VPN, the GRE Method and the VPN's technology and type must match or the policy cannot be selected. For example, you cannot assign a shared DMVPN GRE Modes policy to an IPsec/GRE VPN.

The following topics describe the GRE Modes policy in detail based on the selected GRE Methods:

- IPsec/GRE or GRE Dynamic IP—See [Configuring GRE Modes for GRE or GRE Dynamic IP VPNs, page 26-6](#).
- DMVPN or Large Scale DMVPN—See [Configuring GRE Modes for DMVPN, page 26-12](#).

**Note**

---

When configuring an IPsec/GRE, GRE Dynamic IP, or DMVPN routing policy, Security Manager adds a routing protocol to all the devices in the secured IGP, on deployment. If you want to maintain this secured IGP, you must create a router platform policy (on each member device) using the same routing protocol and autonomous system (or process ID) number as defined in the GRE Modes policy.

## GRE and Dynamic GRE VPNs

You can use Generic Routing Encapsulation (GRE) to create VPNs using Cisco IOS security routers and Catalyst 6500/7600 devices in hub-and-spoke, point-to-point, and full mesh VPN topologies.

This section contains the following topics:

- [Understanding GRE, page 26-2](#)
- [Configuring IPsec GRE VPNs, page 26-5](#)
- [Configuring GRE Modes for GRE or GRE Dynamic IP VPNs, page 26-6](#)

## Understanding GRE

Generic Routing Encapsulation (GRE) is a tunneling protocol that encapsulates a variety of protocol packet types inside IP tunnels, creating a virtual point-to-point connection to devices at remote points over an IP network. With this technology, GRE encapsulates the entire original packet with a standard IP header and GRE header before the IPsec process. Then, IPsec views the GRE packet as an unremarkable IP packet and performs encryption and authentication services, as dictated by the IKE negotiated parameters. Because GRE can carry multicast and broadcast traffic, it is possible to configure a routing protocol for virtual GRE tunnels. The routing protocol detects loss of connectivity and reroutes packets to the backup GRE tunnel, thus providing high resiliency.

For VPN resilience, a spoke must be configured with two GRE tunnels, one to the primary hub and the other to the backup hub. Both GRE tunnels are secured with IPsec: each one has its own IKE security association (SA) and a pair of IPsec SAs. An associated routing protocol automates the failover mechanism, transferring to the backup tunnel if virtual link loss is detected.

**Note**

---

GRE can be configured on Cisco IOS security routers and Catalyst 6500/7600 devices in hub-and-spoke, point-to-point, and full mesh VPN topologies.

---

This section contains the following topics:

- [Advantages of IPsec Tunneling with GRE, page 26-3](#)
- [How Does Security Manager Implement GRE?, page 26-3](#)
- [Prerequisites for Successful Configuration of GRE, page 26-3](#)

- [Understanding GRE Configuration for Dynamically Addressed Spokes, page 26-5](#)

## Advantages of IPsec Tunneling with GRE

The main advantages of IPsec tunneling with GRE are the following:

- GRE uses a routing protocol by which every IPsec peer knows the status of every other peer at all times.
- GRE provides higher resiliency than IKE keepalive.
- Spoke-to-spoke connectivity is supported when you use GRE.
- GRE supports multicast and broadcast transmissions.

**Note**

GRE does not support the use of dynamic cryptographic tunnels.

## How Does Security Manager Implement GRE?

Security Manager implements an additional Interior Gateway Protocol (IGP) solution for GRE. An IGP refers to a group of devices that receive routing updates from one another by a routing protocol, EIGRP, OSPF, or RIP. Each “routing group” is identified by a logical number. For general routing purposes, the interfaces on the routers in your networks belong to an IGP. Security Manager adds an additional IGP that is dedicated for IPsec and GRE-secured communication. This additional IGP is the secured IGP. The existing IGP (unsecured IGP), is used for routing traffic that does not require encryption.

For a GRE tunnel to be established, Security Manager configures a virtual interface on each device. These virtual interfaces are the endpoints of the GRE tunnel. Each virtual interface is unique. The GRE tunnel interface has an IP address (inside tunnel IP address) which is taken from an interface that Security Manager creates. The GRE tunnel points to the source and destination IP addresses of either the physical or loopback interfaces on each device. The GRE virtual interfaces belong to the secured IGP, as do the inside interfaces. Routing updates within the secured IGP are GRE encapsulated and IPsec is applied. A flow whose destination is a secured interface (according to the routing updates of the secured IGP) is directed through the GRE interface where it is GRE encapsulated and then evaluated against the crypto ACL. If it matches the crypto ACL, it is routed through the GRE and VPN tunnels.

## Prerequisites for Successful Configuration of GRE

Consider the following prerequisites before using GRE in your network:

- You must identify the inside interfaces on your devices—the physical interfaces on the device that connect the device with its internal subnets and networks.
- You must select a routing protocol (known as an IGP) or a static route, whenever you enable GRE.

Security Manager supports the EIGRP, OSPF, and RIPv2 dynamic routing protocols, and GRE static routes.

- EIGRP—Enhanced Interior Gateway Routing Protocol enables the exchange of routing information within an autonomous system and addresses some of the more difficult issues associated with routing in large, heterogeneous networks. Compared to other protocols, EIGRP provides superior convergence properties and operating efficiency, and combines the advantages of several different protocols. For more information, see [EIGRP Routing on Cisco IOS Routers, page 64-8](#).

- OSPF—Open Shortest Path First is a link-state, hierarchical protocol that features least-cost routing, multipath routing, and load balancing.

Using OSPF, a host that obtains a change to a routing table or detects a change in the network immediately multicasts the information to all other hosts in the network, so that all will have the same routing table information. For more information, see [OSPF Routing on Cisco IOS Routers, page 64-19](#).

- RIPv2—Routing Information Protocol is a distance-vector protocol that sends routing-update messages at regular intervals and whenever the network topology changes.

Using RIPv2, a gateway host (with a router) sends its entire routing table to its closest neighbor host every 30 seconds, which in turn passes the information on to its next neighbor, and so on, until all hosts within the network have the same knowledge of routing paths. RIPv2 uses a hop count to determine network distance. Each host with a router in the network uses the routing table information to determine the next host to route a packet to for a specified destination.

RIP is considered an effective solution for small homogeneous networks. For larger, more complicated networks, RIP's transmission of the entire routing table every 30 seconds may put a heavy amount of extra traffic in the network. For more information, see [RIP Routing on Cisco IOS Routers, page 64-42](#).

- Static route—Use a static routing policy to provide a robust, stable IPsec-protected GRE tunnel if there is a fixed, unchanging route between two devices. For each device subnet, a static route is created on the device pointing to the corresponding tunnel interface. For more information, see [Static Routing on Cisco IOS Routers, page 64-50](#).
- You must specify an IGP process number. The IGP process number identifies the IGP process to which the inside interface on the device belongs. When GRE is implemented, this will be the secured IGP. For secure communication, the inside interfaces on the devices in your VPN must use the same IGP process. The IGP process number must be within a specified range. If you have an existing IGP process on the device that is within this range, but is different from the IGP process number specified in your GRE settings, Security Manager removes the existing IGP process. If the existing IGP process matches the one specified in your GRE settings, any networks included in the existing IGP process that do not match the specified inside interfaces are removed.
- If the inside interfaces on your devices are configured to use an IGP process other than the IGP process specified in your GRE settings (meaning that the interfaces belong to an unsecured IGP):
  - For spokes: Manually remove the inside interfaces from the unsecured IGP through the device CLI before configuring GRE.
  - For hubs: If the hub inside interface is used as a network access point for Security Manager, then on deployment, the interface is advertised in both secured and unsecured IGPs. To ensure that the spoke peers use only the secured IGP, manually add the auto-summary command for the unsecured IGP or remove the unsecured IGP for that inside interface.
- You must provide a subnet that is unique yet it can be non-globally-routable for loopback. This subnet must only be used to support the implementation of loopback for GRE. The loopback interfaces are created, maintained, and used only by Security Manager. You should not use them for any other purpose.
- If you are using static routes, not unsecured IGP, make sure you configure static routes on the spokes through to the hub inside interfaces.

**Note**

You can configure the above settings in the GRE Modes page when IPsec/GRE is the selected IPsec technology.

## Understanding GRE Configuration for Dynamically Addressed Spokes

When a spoke has a dynamic IP address, there is no fixed GRE tunnel source address (to be used by the GRE tunnel on the spoke side) or destination address (to be used by the GRE tunnel on the hub side). Therefore, Security Manager creates additional loopback interfaces on the hub and the spoke, to be used as the GRE tunnel endpoints. You must specify a subnet from which Security Manager can allocate an IP address for the loopback interfaces.

**Note**

GRE Dynamic IP can only be configured on Cisco IOS routers and Catalyst 6500/7600 devices in hub-and-spoke VPN topologies.

Security Manager uses the Cisco Configuration Engine to retrieve device IP addresses and other information from dynamically addressed devices. Devices that have dynamic IP addresses connect to the Configuration Engine manager at periodic intervals to upgrade device configuration files and to pass device and status information.

For more information, see [Adding, Editing, or Deleting Auto Update Servers or Configuration Engines, page 3-35](#).

**Note**

You can configure the GRE Dynamic IP settings in the GRE Modes page when GRE Dynamic IP is the selected IPsec technology.

## Configuring IPsec GRE VPNs

To configure an IPsec GRE (generic routing encapsulation) VPN, use the Create VPN wizard as described in [Creating or Editing VPN Topologies, page 24-28](#). You can also edit the membership of the VPN, or some of its policies, using the described procedures. If you are creating a hub-and-spoke VPN with dynamically addressed spokes, also see [Understanding GRE Configuration for Dynamically Addressed Spokes, page 26-5](#).

If you need to make changes to other policies and settings, open the policies from the Site-to-Site Manager page, as follows:

- For ISAKMP and IPsec settings, select **VPN Global Settings**. See [Configuring VPN Global Settings, page 25-29](#).
- For IKE proposal policies, select **IKE Proposal**. See [Configuring an IKE Proposal, page 25-9](#).
- For IPsec proposals, select **IPsec Proposal**. See [Configuring IPsec Proposals in Site-to-Site VPNs, page 25-21](#).
- For preshared key policies, select **IKEv1 Preshared Key**. See [Configuring IKEv1 Preshared Key Policies, page 25-44](#).
- For public key (PKI) policies, select **Public Key Infrastructure**. See [Configuring IKEv1 Public Key Infrastructure Policies in Site-to-Site VPNs, page 25-50](#).
- For Generic Routing Encapsulation configuration, select **GRE Modes**. See [Configuring GRE Modes for DMVPN, page 26-12](#).

## Configuring GRE Modes for GRE or GRE Dynamic IP VPNs

Use the GRE Modes policy to define the routing and tunnel parameters for IPsec tunneling in a GRE or GRE Dynamic IP VPN.

To open the GRE Modes policy:

- ([Site-to-Site VPN Manager Window, page 24-18](#)) Select an IPsec/GRE or GRE Dynamic IP topology, then select **GRE Modes** from the policies list.
- (Policy view) Select **Site-to-Site VPN > GRE Modes**, and create a new policy or select an existing policy. Then, select either IPsec/GRE or Dynamic GRE from the **GRE Method** list.

The following table describes the elements on the GRE Modes page for configuring IPsec tunneling with GRE or GRE Dynamic IP.

**Note**

When configuring a GRE routing policy, Security Manager adds a routing protocol to all the devices in the secured IGP, on deployment. If you want to maintain this secured IGP, you must create a router platform policy (on each member device) using the same routing protocol and autonomous system (or process ID) number as defined in the GRE Modes policy.

**Table 26-1** GRE Modes Page for GRE or GRE Dynamic IP VPNs

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Routing Parameters Tab</b>   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Routing Protocol                | Select the required dynamic routing protocol (EIGRP, OSPF, or RIPv2,) or static route to be used for GRE or GRE Dynamic IP.<br><br>The default routing protocol is EIGRP.<br><br>For more information about configuring these protocols, see <a href="#">Prerequisites for Successful Configuration of GRE, page 26-3</a> .                                                                                                                                                                                                                                                                  |
| AS Number<br>(EIGRP only.)      | The number that is used to identify the autonomous system (AS) area to which the EIGRP packet belongs. The range is 1-65535. The default is 110.<br><br>An autonomous system (AS) is a collection of networks that share a common routing strategy. An AS can be divided into a number of areas, which are groups of contiguous networks and attached hosts. Routers with multiple interfaces can participate in multiple areas. An AS ID identifies the area to which the packet belongs. All EIGRP packets are associated with a single area, so all devices must have the same AS number. |
| Hello Interval<br>(EIGRP only.) | The interval between hello packets sent on the interface, between 1 and 65535 seconds. The default is 5 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Table 26-1 GRE Modes Page for GRE or GRE Dynamic IP VPNs (Continued)**

| Element                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hold Time<br>(EIGRP only.)                      | The number of seconds the router will wait to receive a hello message before invalidating the connection. The range is between 1 and 65535. The default hold time is 15 seconds (three times the hello interval).                                                                                                                                                                                                                                                                                                                                                                           |
| Delay<br>(EIGRP only.)                          | The throughput delay for the primary route interface, in microseconds. The range of the tunnel delay time is 1-16777215. The default is 1000.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Failover Delay<br>(EIGRP only.)                 | The throughput delay for the failover route interface, in microseconds. The range of the tunnel delay time is 1-16777215. The default is 1500.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Bandwidth<br>(EIGRP only.)                      | The amount of bandwidth available to the primary route interface for the EIGRP packets. You should enter a value that gives priority to the primary route over other routes.<br><br>You can enter a value in the range 1 to 10000000 kb. The default is 1000 kb.<br><br><b>Note</b> By default, the cost of sending a packet on an interface is calculated based on the bandwidth—the higher the bandwidth, the lower the cost.                                                                                                                                                             |
| Failover Bandwidth<br>(EIGRP only.)             | The amount of bandwidth available to the failover route interface for the EIGRP packets.<br><br>Enter a value in the range 1 to 10000000 kb. The default is 1000 kb.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Process Number<br>(OSPF only.)                  | The routing process ID number that will be used to identify the secured IGP that Security Manager adds when configuring GRE.<br><br>The range is between 1 and 65535. The default is 110.<br><br>Security Manager adds an additional Interior Gateway Protocol (IGP) that is dedicated for IPsec and GRE secured communication. An IGP refers to a group of devices that receive routing updates from one another by means of a routing protocol. Each “routing group” is identified by the process number.<br><br>For more information, see <a href="#">Understanding GRE, page 26-2</a> . |
| Hub Network Area ID<br>(OSPF only.)             | The ID number of the area in which the hub’s protected networks will be advertised, including the tunnel subnet. You can specify any number. The default is 0.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Spoke Protected Network Area ID<br>(OSPF only.) | The ID number of the area in which the remote protected networks will be advertised, including the tunnel subnet. You can specify any number. The default is 1.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Authentication<br>(OSPF or RIPv2 only.)         | A string that specifies the OSPF or RIPv2 authentication key. The string can be up to eight characters long.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Cost<br>(OSPF or RIPv2 only.)                   | The cost of sending a packet on the primary route interface.<br><br>If the selected protocol is OSPF, enter a value in the range 1-65535; the default is 100.<br><br>If the selected protocol is RIPv2, enter a value in the range 1-15; the default is 1.                                                                                                                                                                                                                                                                                                                                  |

Table 26-1 GRE Modes Page for GRE or GRE Dynamic IP VPNs (Continued)

| Element                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
